Menlo Park Notebook #53 [N-80-03-14], Cat. 967

This notebook covers the period March-July 1880 and contains 288 numbered pages. It is one of two journals kept by Charles P. Mott, which record daily activities at the Menlo Park laboratory (see also Menlo Park Notebook #117). There are also six pocket notebooks that were probably used to record these daily activities prior to their being entered, sometimes in expanded form, into the larger notebooks (see Pocket Notebooks). This journal begins approximately one month before the earliest extant pocket notebook. However, the last pocket notebook contains entries for the period January-March 1881, which are not found in the journals. Some of the entries in the journals are cross-referenced to the experimental notebooks. Together, these books provide a narrative record of the last active year of the Menlo Park laboratory up to the time that Edison moved to New York City.

On Wednesday night and during the day on Thursday of last week (Mch 10 & 11) Professor Barker, Thaulow, and Rowlands were here, taking measurements of the candle power of the Electric Lamp and of the number per horse power, finding (I believe) very nearly twelve per horse power of sixteen candle power each considered by them a very favorable result, intending I believe to return some future day to test the energy of the generator and of the horse power expended upon the machine. after which a full record of their tests and measurements will be published, whether favorable or otherwise.

The measurement of the energy expended in the lamp was made by first weighing the lamp, next submerging

it in water, taking the temperature, then putting on the current and noting at different periods the increase of temperature, for the space of five and in some case Ten minutes, turning off the current and accurately weighing the water, and from this data and these figures form the basis of their calculation of the number of lamps per horse power.

During the past week John Ott has been at work on a new Relay, with electric motive power of different form and pattern than the electric engine or motive power previously applied to the relay and telephone, W. P. Adams at work on quite similar but different electric motive power or engine for chalk telephone. Livingston at work on Hot air engine experiment Dean on mould for pressing Black Lead or Plumbago into carbon size and form, an instrument requiring exceedingly neat, careful, and exact workmanship. Some other of the men have been and are still at work on the large generator and today have one of the magnet wounds.

I judge some important business was being transacted yesterday Mess 13. from the fact of many telegrams being recd. and sent pneumatic in relation to Edison's relay.

Today his Uncle from is here visiting him; otherwise the day is quiet and disagreeable.

Sam Mott stuckless off the Bay Rock last night. also Beach.

Monday Mchi 15

Ondum' Telephone chalk motor W.E. good power but too noisy.

Hot air long experiment tried to night but found to be in its present form useless experiment to be made.

Stamp mould for Plumbago burner finished and tried, found quite satisfactory but needed some little addition which is being made by Dean, tonight

New motor relay finished by Geo this evening but not tested up to time of [illegible]

Motor runs very quietly but with low speed and power, it was discovered that by connecting the poles of the magnets with a brace of iron or steel, that the speed was greatly increased but no increase of power — rather out of the ordinary and usual law of speed & power

Geo Barman plating inner of carbon horse shoe with nickel, copper & silver, find nickel to require a much stronger current than other metals

Wednesday, March 5th

[illegible] the information from Mr. Upton in regard to the last night's tests and measurements which he is continuing to night.

Mr. Batchelor still at work at paring Plumbago & suggested to him the preparing and passing of carbonized paper or card board but am informed that it cannot be passed sufficiently to be useful, should like to see carbonized card board prepared and tested with Plumbago time in the pass and if of sufficient strength and [illegible] & am of opinion it would make as fair carbon as the [illegible] to suppose the [illegible] would be sufficiently light

Strong and [illegible] [illegible] the experiment [illegible] that [illegible] [illegible] time and [illegible]

succeeded in getting from it forty ~~eight~~ one revolutions per minute quite encouraging in comparison to their first efforts.

The generator with thirty (ten) discs finished and ready for the belt but not tested because of insufficient lamps to try its power.

Mr. Clarke diligently at work figuring out the illuminating power of the edge of carbon horse shoe see note Book No. 66. pg. 223

Mr. Edison (& Wife) left here today for Philada. on his way home.

Thursday March 18.

Mr. Batchelor is this evening pressing Plumbago in thin sheets between tissue paper and then cutting out in horse shoe form and carbonizing have some out yet (10 P.M.)

All work on Hot air Engine ceased last night in consequence of Livingston having cut his hand and not on duty to day.

Mr. Upton at work on calorimeter measurements, but does not consider the system of so much accuracy as was attributed to it by Professor Rowland as the original temperature of the water as compared to the surrounding atmosphere has a great effect on the results obtained cold water being brought to the temperature of the air more quickly and easily than it can be carried

Mr Greene, President of Western Union Telegraph Company wrote President of Edison Electric Light Co. have spent this afternoon here.

Friday March 19.

Mr. Edison left for New York on 11 20 train to return to-night.

All things very quiet about the Laboratory. Professor Brackett & Young with assistant Magnus of Princeton came on 11 20 train made measurements of candle power, tested electrometer for accuracy and amount of copper deposited in one half hour burning. Calculated horse power expended on generator, and the energy of machine. Up to present the only results I have been able to ascertain are that the armature gave but 14/100 or about one seventh of an ohm resistance and the magnets .102 ohms resistance.

Their tests and measurements were conducted with great care, and their aim appearing to be, minute accuracy. At their own suggestion their report will be sent to Mr. Edison to use as he may desire.

Thomas Alsaden

8 C Engineer

Saturday March 20

Dean at work on new mould for pressing and moulding Plumbago on ends of fibres. Clark has for a day or so past devising an apparatus for measuring the cross sections of fibres, by suggestion of Mr. Edison. is also devising a balance to weigh carbon loops which will necessarily be an exceedingly delicate apparatus inasmuch as a scale used in the laboratory and weighing to one half a milligram is not deemed nearly delicate enough. Three or four lamps were sent to day by express to Prof Barker of Penn University.

see note from No. 72 to 20 & 72

Several Newspaper Men. (Pro- a Sun & a Tribune man) have been here this evening

This night be called an off day for this place, very few people

interesting experiments having been tried so far as I have been able to learn. The large generator was run for heat a while tonight but did not sufficiently magnetize before stopping engine to complete the test.

Sunday Mch. 21

Dear continuing work on our mound, but otherwise nothing doing in Ship or Laboratory.

So night is the first Sunday night since I have been here and I believe for months before I came, that the Engine has not been running and work in Laboratory proceeding the same as at other times, and it is now understood that night work for the present shall be discontinued. Mr Batchelor's complaining of his eyes is the present inducement for making this change, which will undoubtedly prove advantageous to all who have from choice or necessity worked nights and slept and rested during the day - and a saving of considerable expense in night meals which have heretofore

cost from $1.20 to $1.40 per months during the winter.

Monday Feb. 22.

Dean finished second for Glamorgan under the filter and this evening Mr. Ratchelor made two unsuccessful attempts to get the filter out in vacuo. He would however don its wonds very nicely and he will probably be able to get out some during tomorrow. Mr Edison sketched another design for mode for same purpose and gave to Dean to make.

Have been running large armature all day for heat test find it heats some but could not learn from Mr. Upton the number of degree increase, not so much however I believe but what it will be able to stand. and

Reported here that on Friday last Mr. Edison in New York City disposed of his stay to Western Union Tel. Co. for $.000.

Prof. Upton & Schi at work on Photometric and Calorimeter tests probably for their own edification and practice as it is entirely useless to make any arrangements for them in regard to their investigations.

Prof. Barker here a short time in afternoon.

Miller here and said that during last week he filed for Mr. Edison six applications for Patents one a day. I stopped applications for two weeks day in Interference cases Edison vs Dolbear & Edison vs Dolbear vs

Sunday Feb 23.

Clark has all at work on his apparatus for measuring force. Mr. Edison, Jas. Carman, Crosby and Kipple at work on experiment of communicating sound through small lead pipe ~~leading~~ one eighth inch diameter inside leading from Laboratory to office have not yet obtained desirable results.

Quite a large party of Navy officers (Swedes) here this evening and apparently well pleased with the lights, sights, and the courtesies shown them by Mr. Edison.

I learn from Mr Quiter to day

that the large generator without armature, weighs two tons and has to day been removed into the new Station"

To days Sun gives the particulars of the sale of Edisons Electrograph to the Western Union Telegraph Company.

Mr. Wilber here this evening, he and Mr. Edison at work up stairs.

Wednesday Feb 24. 80

Geo. Carman continuing experiments on lead pipe and having attached a mica diaphragm at his end connected to battery of telephone by wire, and also connected to relay and sounder, could write them quite well from other end of pipe, in further end of Laboratory, by connecting to that end of the pipe a rubber tube and by slightly compressing it forced air sufficient to act upon the mica disc, breaking and completing the electric connection, and thereby working the relay and sounder.

Dean finished and is using to-night a tool with which he turns a hair fiber down to $\frac{15}{1000}$ and drills therein a hole of $\frac{1}{1000}$ diameter hole drilled lengthwise of fiber an exceedingly neat and exact tool and doing remarkably fine work.

Ds at work on balance devised by Clark and himself. And Clark near finished weights for same of exceedingly fine platinum wire the least being tenth of a Milligram.

Ds and another spoke here today and were examining under microscope some waste or dump of gold mine in which Mr Edison had tested his Cu Milling process and which showed plenty gold and platinum, although none could be discovered even by use of the microscope before the process was used.

Upton and Lehr operating on an

see calcimiller this afternoon and
evening – that are –
Mr. Dean in behalf of Mr. Benson
saw this afternoon in relation
to lamps and sockets for lamps
for use of Oregon Steam Ship
Navigation Co. and it was finally
arranged to have the sockets made
here (as furnished by Mr. Edison)
the boys at work bright cutting

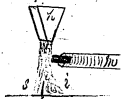
lamps for the ones –

Thursday March 26

Mr. Edison experimenting on magnetic arrangement for separating iron or other magnetically influenced mineral from sand or other finely divided matter. A magnet is so arranged that the sand passes sufficiently near for the magnet to influence the iron from its course and separate from the silica. A bin is arranged with a long narrow operation in the bottom through which the sand passes in a steady broad, thin stream. A short distance below is set a magnet whose ends come sufficiently near the stream of sand and attract it from the green current ~~[illegible]~~ to act upon the iron particles but not near enough to allow the metal

to attach itself to the magnet. A board or other dividing partition is provided and placed so as to allow the influenced metal to pass and lodge on one side over the magnet while the uninfluenced sand will continue to fall perpendicularly and lodge on other side of partition.



h represents hopper
m. magnet s silica or matter uninfluenced by magnetism i iron or other metal and b the partition board. The test made with it to day would show probably ninety per cent (~~absolute~~) separation

Dean turned bast fibre down to $\frac{1}{16}$ to $\frac{1}{32}$ long and drilled $\frac{1}{32}$ hole through centre lengthwise. Mr. Batchelor insulated manilla fibre through them and had the whole cartridge and got them on

ready for Lamps in perfect order and naturally feels quite proud of his achievement

Clark and Garrow been for a day or two experimenting on sensitive wash for paper for photographing tables, tracings &c.

Papers accounts of Lecture of Prof. Barker on Edison Elec Light (see Friday - 26 - pge 36)

Have continued experiments on separating iron sand in manner described yesterday and by having the sand pass through a vessel of water thus retarding the fall and giving the magnet more time to act upon the iron and draw it from the perpendicular descent. Have also rigged this morning an apparatus to experiment on dividing the sand by air blast (or winnowing) using therefore a forked glass tube having the sand pass down through one branch at same time air is being forced through the other branch, both passing out of a common mouth, the iron and heavier parts falling and lodging nearest the mouth. The boys are instructed to experiment with magnet in connection with

The winnowing apparatus
The Papers of to-day contain accounts
of Professor Barker's lecture on Edison's
Light, delivered Mch. 22. in the
Chapel of the Pennsylvania University
and which give to the light really
more than has ever been publicly
claimed for it by Menlo Park. They
also contain Sawin's general declaration
that none of the statements are true
that Barker is mistaken or wilfully
misrepresenting and that Edison
knows nothing.
Find day working to reduce the
Pay Roll about $50 in addition to
the saving of $30 per week for
night meals

Saturday Mch 27.

Nothing new or of especial note or
interest doing that I could hear
of up to three o'clock when I
took train for home, where I remained
until Monday night, returning at
Midnight.

Sunday and Monday – about

Sunday March 30.

Experimenting on various forms of clamps and connections for fibre carbons trying Oak and various other woods for the carbons and Mr. Edison this evening reducing tissue paper to a pulp to test for carbons but appears to have but little faith. a Gaulin suggestion imported by Geo. Upton,

Boehm preparing an apparatus for carbonizing by electricity in a vacuum,

M. L. Larson and C. Campbell of San Francisco here today. had with them some samples of Gold ore from which Mr. Edison obtained $180 worth of gold - as I am informed by "Baisie"

Got for Dean, the smallest die that could be found for cutting the

screw but on trying it he finds it only about one half small enough in other words he will undertake to make one a little over one half the diameter or about 10 to the millimetre. - He turning Oak down to this and drilling fifteen lengthwise a hole for use on ends of manilla fibre carbons.

Mr. Upton and Edison trying by use of friction dynamometer to ascertain the horsepower being exerted on generator, but I could not learn the result.

Wednesday March 31.

Mr. Serrill here looking up papers and getting evidence ready for telephone interference Edison vs Shott.

Otto making further experiments on telephonic motors.

Dean at work on electric paste of apparatus for carbonizing in vacuo by electricity.

Experimenting tonight on dredging sand by centrifugal machine driven by electricity, tools sewing machine motor from Office for the purpose first the sand to dry very quickly and second fit to sieve in a few minutes (say 10)

Quite a number of Mining men here today one bringing black sand tailings from Bragie but the Dr

could find no gold same man brought some substance resembling rotten stone which could be ignited with match and burn for some time emitting a smell similar to the smell of burning animal oil. also said to produce gas in large quantities.

Thursday April 1

All still at work on Telephonic water experiment. Kipple and Beaty on centrifugal apparatus.

Mr. Edison tonight commenced experiments on pumps with the view of using single instead of double pumps as at present also of combining or arranging a large number in small space; has on two laterals of fiber carbon, globes made tube shape

Friday April 21, 80

Mr. Edison still on pumps, traps and centrifugal dryer,

Orders rails for electric railway - sufficient to lay track ½ mile long.

Dean and Brown finished their work on apparatus for carbonizing in vacuum. The glass pump part up this evening but no connections made.

Saturday Apr. 5.

Professor Young & Brackett are making tests of the generator. and have spent the greater part of the day on them.

Mr Edison has been rummaging the old books and papers for matter in relation to telephone

Mr. Batchelor has been pulping paper by steam and subjecting it to immense pressure, do not know the intention.

I copied Preliminary Statement of T.A.E. in Interference T.A.E. vs Anderson & Dolbear. Mr Miller came in evening and took Statement with him to Washington

Find that the pressed pulp is intended for clamps or contacts for the carbon

with the connecting wire.

Sunday April. 4.

Find on my desk this morning for copying, a letter to Nicholas Guen in relation to Patents on Maps. also Patent for Separating magnetic substances from non magnetic substantially as decided herein on March 25. Patent Numbers (applications) 216.

Letter to Mr. Guen refers to Patentable forms of map which in part as in lots annd the Page Patent and is intended to be accompanied by 16 different sketches of the manner it is accomplished by Mr. Edison's invention.

This afternoon and evening Mr. E. and Batchelor are experimenting on the methods of carbonizing in vacuum. but the efforts so far

have been discouraging all the carbons or attempts at carbonization, having occidized, a regular mercury air pump has been prepared and set up and a globe shape glass vessel fitted air tight on pump, when vacuum is obtained the electrical current is completed through the mercury which is caused to ascend a double tube and form contact with iron wire, attached to the wires for holding the paper or fibres encased in the globe, extending down the tubes, or double tube, this whole apparatus neat and complete but a perfect and absolute failure as a carbonizer (Note book No. 51. pgs. 180.

Wm Holzer and Gauron experimenting on glass with acids, giving it the appearance of ground glass. Holzer instructed to experiment in the inner small globe with different [illegible] of grinding with [illegible]

Jan. E. Chapman begins to log under Vacuum and Mercury Work. Note Book No. 51 No. 23 pm.

Monday April 5

Mr. Sewell here and taking testimony in interference case (Short) part of which I copied and gave to Mr. Griffin.

Mr. Wilbur here in evening and took papers which I copied. on Sunday but was unable to get Griffin's signature ~~last~~ evening. Took letter book copy of Patent in Book for that purpose commencing on Page 1st & of letter to Green on last page of same book.

John Otto finished a new receiver and motor connected therewith but does not think it a success himself. The shaft being directly on shaft of revolving armature, revolves too rapidly, and not running as

quietly as those previously made.

Moffett finishes a more complete apparatus for experimenting on magnetic substances, one for dry, placed up stairs in Laboratory & one for wet, and to be used in connection with water pipe. put up on outside of Laboratory near side door.

Tinney and Mack Force have got the use of the western R.R. Tel wire to and back from N.Y. City & Philada. and are telling he autographic over fifty (50 from N.Y.) and one hundred and twenty (60 from Philada) miles of wire, and have had fair results. later in evening got very good results through the New York wire.

Tuesday April 6.

Some parties from the American Machinist here today indicating the horse power of the engine expended on the machinery and generator and the horse power expended on the generator alone.

One of the generators moved into the Laboratory for me, I believe, as a motor for driving pump for hydraulic press.

Geo. Carman & Mr McLaughlin passed here at about 9 30 this morning for California

Sam. Mott set at work on drawing of very thin wood (or veneering) to be cut in narrow strips, but in horse shoe or other shapes for carbonizing for me in Lamps, do not know whether the experiment has yet been tried see note book 51 page 2780.

A Copy for Mr Batchelor the statement of result ~~to~~ has Mr Clark has obtained in his experiments on the carbon in telephones, an interesting and quite ~~in-~~ lengthy ~~teresting~~ paper. see note book No. 72 pg 258.

I had some words with Mr. Carman and was by him informed that I might consider myself discharged, but replied that Mr. Edison was my employer and that I looked to him alone for such action and continued at work all day, amongst other things balancing the books.

Wednesday April 7. 80

Mr. Serrill & Edison overhauling all old telephone papers and assorting and classifying them for use in interpreting cards.

Mr Batchen having John Ott make apparatus for working wood down to proper thickness and for cutting strips therefrom to be carbonized for burners. after tea relocks in evening cut come off very nicely and believe they have struck a good thing. It yet remains to be seen what sort of carbon the products will make. Books 57 pg 3186.

Mr Verney and Fox jubilant over the belief that they had obtained excellent results on autographic to Chila. and return, but Mr Edison informed them that in reality they were working only from one instrument to the other a distance of not over three feet, and

after some difficulty in making them understand why that was the case, and directing them to place a ground wire between the machines they could get nothing readable

The boys tonight testing their strength and bottom on generator in Laboratory and Mr. E. stands at head on 143 volts. The least of them however were able to produce a fair light on lamp attached to the wires from the Main impulsa generator. Note Books No. 82 pg 8584.

Thursday April. 8. 1880

Those at work on the lamp and on carbons (Batchen Frec. Mr Edison Flammer and some of the men in Shop) greatly interested in the efforts to devise suitable means and devices for reducing woods to sufficiently small dimensions for carbonizing, and have been trying several different devices. All being of opinion that a very fine keen saw will leave the wood smoother and in better shape for the carbon. Had some carbonized late in the evening but they did not turn out entirely satisfactory being somewhat warped in shape.

Lecky & Kingsley of Wood Hill 1881 pg 85, 4 1/2.

Lecky and Hipple making some crude experiments on sand blast, using steam, and considering the inappropriate apparatus (simply sand lain on a board and forced by steam against the glass) they got very good results.

Mr. Edison, Upton & Francis making comparative tests of Edisons Dynamometer and calorimeter,

Mr. Holzer made new style of glass cup for filling pump joints with mercury.

Friday April 9.

Etta carrying on their wooden experiments on various kinds of wood and have had Martin Force out gathering what natives could find.

Mr. Lomig at work on diagram of track and stairs for the Electric tramway.

Clarke calculating the size of wire necessary for running about the Carbon to the lamps and the factory (see Note book No 66 pages 64.68 & 70 etc) & Book page 103

Lawson experimenting on extracting the gum and resinous elements from different woods to prepare them for carbonization, Put them in alcohol at two o'clock P.M. Bottle 32. 1/4 109

He and Hammer also experimenting on cleaning Mercury, got best results with sulphuric acid and Ferric chloride of Iron.

Blue gravel Dry Creek tunnel, Yellow gravel Dry Creek tunnel, Davis Gravel Thompson flats, Chamberlain Gravel Thompson flats, Dry Creek tailings bottom dry creek tunnel, Put in bottles in water and labelled.

Brehm made glass syphon for experiment on the new single Springle principle pump see Note Book No 68 page 7. and which dated April 12. 1880.

Anderson at work on apparatus for holding spirit lamps sort of a stand. does not know the use they are to be put to.

Mr Serell here classifying minerals for telephone interference case

Saturday April 10.

Heating roasts stove furnace devised by Holzer and Moses being tried and tested by Mr Holzer and found to work admirably both standing and retaining the heat exceedingly well.

Several of the men at work during putting down sleepers for rails of electric tramway, Voorhees preparing copper connections for joints of rails, and efforts being made generally to push the road to completion as soon as possible.

Wood Loops, Dean making tools for stripping wood for loops and drying and making attachments for Lathes for doing the work.

Carbonization, tested moulds of several different kinds of wood carbonized the A. M. and came out good carbons but somewhat misshapen. Gums and Holly coming out in best shape and most perfectly. The Resistance varied from 130 ohms (the lowest) to 180 (the highest) Note Book No 57 page 103 &c.

Pump, Mr Moses trying the new Springle drop pump with syphon attachment, as a whole finds it does not give results entirely satisfactory, Mr Edison with much reason attributes the partial failure to the syphon attachment rather than to the pump itself.

Annealing oven, Andrews at work on an ~~oven~~ spirit lamp oven for annealing glass, devised by Holzer.

Sunday April 11. 80

Electric tramway. The track men of the section of the Penn. R.R. are laying sleepers and spiking rails on the electric road and work on it being pushed as rapidly as possible in all too soon are on the work today.

Wood boys while Holly first put in lamp about 5 o'clock this P.M. first on pump and heated up at six. one having a bad spot broke at that point before sealing off, the other remaining on all night

Pump, it was noticed that in pouring the mercury in the globe reservoir, that the force carried more or less air into the globe from whence it found its way into the syphon and thence to the pump to obviate which Dr. Moss had tube made closed on bottom with aperture on side near the bottom so as to break the fall of the mercury and distribute it in the bottom of the reservoir with less force, found it to remove the difficulty of air in the syphon but still the pump did not work as completely as desired.

Holder, the first armature with the new style of commutator brush holder finished and put in this A.M. by new style is meant an arm attached on part of box cut for that purpose and secured from turning

Monday April 12

by a set screw and upon same generator was put the first plate invented "Edison Electric Light Co." New York. at just 12 o'clock at night and the machine completed entirely.

Lamp. Lawson and Holgin treated Platinum lamps by Thai process (for gasinating the glass of the lamps). The acid acted upon the surface of the glass rendering it opaque like ground glass the action was very uniform and and greatly mellow the light given out by the lamp.

Breaking iron, composed of a round bar arranged to hold lamps close together on upright rod, a movable bar on same with arms of wire extending horizontally with ring on end sufficiently large to admit the small end of inner tube to pass through

bottom to the second bulb which rests in or upon the ring with another lighter wire extending from the larger arm above it with spring holding device, to hold the thinner or long end of the tube from toppling about, the whole is then inclosed in a metallic shell about ten inches in height.

Wood ~~Fiddow~~ holly lamp still on pump tonight and giving off considerable air every time it is heated up.

Wood Lamp Dean at work yet at twelve o'clock making tools for getting out the wood lamp in the desired shape (U shaped) and to obviate the necessity of steaming and bending.

Flammer and Fine making a device for steaming and bending, by means of a weight, at same time.

Mr. Upton making a double calaminder lots of generator. passing the current through

Calorimeter one with about 189 and the other 280 lbs of water. the first test that has been made in that manner.
Book 82 pg. 187

Automatic, Force and Vinney are tonight using the W.U. wire for experiments and tests of the automatic telegraph through Fleur Cords and get very good results

April 13. 1880

Pump. Boston making drop pump after sketch and plan of Mr. Upton. Note Book No. 63. pg 98.

Wood Milling. Dean finishes and is using the lathe attachment for cutting wood out in required shape whereby the steaming and bending is dispensed with. He uses a size former () Steel shaped in which travels the emery a solid steel rod and guides the working cutting knife the to cut just the form and required thickness without danger of cutting where not desired. Book 57. page 55

Pyrites - Lawson commences a series of experiments with the view of obtaining gold and other metals from Pyrites tailings.

Motor. The generator set up in the Laboratory was run as a motor and tested with Prony dynamometer, which showed a power of 68.100 ft pounds Book No. 59

Calorimeter. A double calorimeter test over carefully made by Brown and Mott assisting Mr. Upton. Book No 82. pg 161.

Copper conductor. Clarke's calculation of the size and weight of conductors necessary to supply electric current to the lamps being put out about the works and to the old factory for motor purposes, finishes and as one of the results he finds that 6.3 tons of conductors will be necessary. Map and results given to Mr. Upton. Note Book No 66. pgs 66-68. 70 & 82. pg 108

length to be 27600 ft. Upton Works to date 3½ m.

Magnetic Separator. Crosby & Hipple running the magnets for a rather limited time on ores the other for separation

Magnetic from non magnetic material
and got excellent results, much
better than they got with the magnetic
side by side.

Sealing over Holzer trying sealing
now and seems satisfied with the
working entirely successfully.

Wood carbon white holly still on pump
giving an excellent light.

April 14

Interference Mr. Edison and Batchelor with several of the boys hunting up from amongst the archives, all telephonic apparatus they can find and using such as are appertinant to the Interference case Short & Edison in dispute in which is being again taken.

Wood carbon lamp of white holly broke in glass on the pump about eleven o'clock this A.M.

Wood loop of proper shape gotten off the machine to day, guide a mission having been cut by Mr Wright. The machine was then stopped to arrange it to run 7000 revolutions per minute, and Dean making new cutter for it.

Steam Ship of Oregon Steam Navigation co. it is learned by letter will leave Chester for New York on the 17th April and work on the generator in shop is being pushed to have them ready for use thereon.

Wire armature machine in Laboratory run as motor, and made its own momentum carried it 148 revolutions after armature was opened, 243 Rev. field off and armature opened, 161 field on brushes off. Machine now in use .037 plate made under same trials 336 Rev. field off brushes and armature on, 295 Rev field and brushes on. 277 & 269. field and brushes on.

Thin disc new machine with field made from revising made 845 Rev. after bringing up field, 476 & 465. with field and armature off. 759. Revolutions.

Pump Dr. Moser took a crow the cephalon pump and had air traps attached and made exceedingly like the regular Springs.

April 15-80

Hydraulic Pump delivered on deck of Laboratory this morning.

Test of the current of main wire in Laboratory this morning, made by Mr. Upton with meter and Electric Dynamometer. Book 82. page 178 &c.

Also test of wire generator in Laboratory as motor with wooden Prony. Dynamometer, Book 59. page 207 and Book 82 page 185.

Bochm at work on new pump sketches on page 25 Book 68.

Great evidence being continued all day.

Magnetic separator. Crosby and Nipple experimenting on ~~stand~~ magnetic separator bringing as many as five magnets one above the other and practically as good results as have been yet obtained. Through hopper now in use they run 25 lbs per minute and separate it very completely

New form for cutting card board loops made somewhat under direction and finished and in use to day by Van Choi from which he cartonized thirty nine cartons

Loop cutter sketched and described by Mr. Batchelor in Book No. 57 page 75 directed to be made by Dean.

Frictional resistance of belts and pulleys of Edison Dynamometer as now in use in Generator room reported by Mr. Edison to be calculated by Mr. Clarke Book No 72 page 68 &c.

Bradlee & Wood report on comparison between Prony and Edison Dynamometers, being carefully made and computed by Bradlee from list of 10 minutes. Prony Registers 612 1/2 horse power Edison 527 666 ft lbs. by Bradlee reading 690 880 ft lbs. in this last reading Prony registers 88.6 per cent of work registered by Edison Dynamometer which was driving it.

Second comparison 4 minutes test Prony registers 310,680 ft lb and Edison reg. 333360 ft. lb. Prony indicates 93.2 per cent of work indicated by Edison

Faradic test 13 m 53 sec Mean Dynamo gen 994.6 Mean speed of main shaft 172 Rev. Energy expended on driving armature 2839500 ft. lb. and on field of frame 196640 ft lb Total energy received 2416147. available 2284845 Total efficiency 84.5 per cent available 78.2 per cent

second test of Generator 9 minutes gave same perct. of efficiency.

Street Lamps Nine hundred of large Globes for street lamps were received to day.

Ambent Lamp. Three moreau of natural cat. loops carbonized today

Second generator for Columbia finished up and running to night.

Friday April 16

Carbons Three moulds of natural cut loops taken out and Thirty card board horse shoe cut by new form broadw at hub, taken out this A.M. Book 57 page 115.

New Receiver the late form [illegible] by Mr [illustration] has new chalk put in it this A.M.

Sluice box stitched and Hipple and lively requested to bend it. to be experimented on in connection with the magnetic separator

Pump experiments. Upton and Sihl put up induction coil and condenser in dark room to be used in connection with experiments on pumps now being conducted by them. Dr Moore continuing pump experiments up stairs

using scales for weighing mercury and battery and alarm in connection therewith.

Electric tramway men at work on the tunneling and Krenz, Konig & Co devising new attachment to screw the magnets and brushes and control the movements of the car motor.

Armature of .034 disc no plate that has been in use for some time, was taken out by Cunningham and found to be considerably out of balance which had undoubtedly been the cause of that machine running with more or less of a thumping jar, and causing considerable more wear in the journals than would result from one perfectly balanced. After balancing and replacing it was found to run smoothly and free of any jar.

Arm and lever attachment sketched and suggested by Mr. Edison last night is being gotten up by Dean. The purpose of which is to act as a guide for cutting the wooden loops
Book No 57, page 67, 68.
Shipped Wesson electric dynamo machine to A. Bugmann 100 Worcester St N.Y.

Wood experiment. Martin Force is planing holly down to .02 in. thick to be cut in loops by same method and form used in cutting card board.

Electric Governor. All finished and polished up the electric governor so that at 260 revolutions it acts very promptly and sensitively and they found that at 280 revolutions it exerts a force of five pounds on spring scales. I do not consider the spring balance will properly show the force exerted from the fact that the hook and bar to travel through too much space to show small differences on the dial whereas

whereas a scale (platform) would act through but little space and might show quite differently the pounds of force exerted by the governor.
By dispatch from F. McLaughlin dated 16 April lying on desk I see that he says he has shipped tailings from Tyson Gordons
Short Interference evidence taking continued to day

April 17

Columbia. Two Faradic Machines complete. No. 11 & 12 Shipped to day in care Morgan Iron Works foot 9th St New York for steamer Columbia.

Press. Partition between Old Office and Laboratory part of frame building taken out preparatory to setting up the hyaraulic press.

Generator test Mr Upton made a test of the 25 K Edison generator, with two cells, Daniels & Fullers as field of force, getting 25 volts, Book 82 pg 201 Also tested wooden loop Camp No. 1029 Book No. 82 page 204 &c.

Frictional resistance of belts and pulleys. Mr. Clark finished calculation of the frictional resistance of the belts and pulleys of Edison Dynamometer total frictional resistance

20059 ft. lbs Book No 72 page 68 &c. he is now preparing to make a practical test to demonstrate the accuracy of the theories on which he based his calculations.

Reverse revolution for electrical tramway sketches and plan given to Att for him to make patent for castings ~~the contractment~~.

Reporter Two french gentlemen said to be reporters here this P.M. and shown through the works by Mr Upton.

Glass. Man here with sampler and extolling the merits of a malleable glass.

Wood horse shoe, Vaughn cast from the 12 holly wood prepared by Force, a regular horse shoe loop in new frame. brought it out entire.

April. 18

Electric tramway. Three men straightening and grading track. Three laying and spiking rails, and three at work on tunneling and other parts of the road. in all nine men on the work.

Pump Francis had Holzer make pump after his design. which is very simple, free of stop cocks, takes but little room, and comparatively little mercury, tried in evening and pump vacuum up to one half of gauge tube obtained in a little over an hour. he had also made a rubber stopper cup or socket in which to make the lamp connection without the necessity of using ground glass stoppers.

The regular pump men Beach, Hammer, and Strong, absent and E.P. Mott running the pump.

Bracket, designed for Steamer Columbia sketched by Mr. Krusi is being made by Mr. Andrews. Book 50 page 1762

American Machinist report being revised and corrected by Mr. Clark. Book 72 pg 99 92

Ore and tailings being crushed and to prepared for Mr. Edison & Dr. Kidder

April 19.

Wood loops Van Elsor cutting have shoe loops from .02" Scotly milled or planed down by Dean put thru in form at anytime and got out two after carbonization in good shape and appearance.
Mr. Batchler making careful calculation, and sketch for new wood milling machine and has Dean at work on it.

Pumps. Francis put one wooden loop Lamp on his pump in Dark room and got vacuum and heated up in two hours.
Dr. Moses with two paper loop lamps got good vacuum in five hours but had not heated. from these first efforts it would be difficult to say which of the pumps were best for a quickest for getting vacuum. but the pump in use by Francis is

much the simpler, cheaper, and occupies less room. Brehm making a new pump slightly different from either just mentioned sketch Book 68 page 89.

Lamps for Columbia were measured for resistance and photometric value. put into stands and gotten ready for packing. It was noticable, that the loops cut after the new wide head form did not generally give as many candles as the old style loops. Bk 82, pgs. 209.
Lamp steam spark gave 25 c. gave 23 after heating
Columbia. Dynamo Armature Machine No. 1 & 14.
for Steamer Columbia finished up and tested. 13 proving O.K. but No. 14. gave no current and the armature was taken out by Cunningham and found to have a bad cross. which he is at work on remedying.

Mr. Lawson is preparing for a practical test and application of electric motor on the line in Laboratory.

Ores and tailings Mr. Edison and Dr. Hyde assisted by Crosby are experimenting and testing ores and tailings, quite a quantity of which have lately been received.

Globe mould. Holzer and Young devising and the latter sketching form of mould in which to blow the larger or outer globe for the electric lamps.

Hydraulic press. A man is here cleaning up and putting together the hydraulic press lately received.

Columbia. Faradic machine 13 & 14. Shipped to steamer Columbia care Morgan Iron works foot East 9th St. Mr. Upton sent to New York this A.M. carrying with him a couple lamps for the steamer, to see whether the wires and connections were properly up and made and ready for the reception of lamps &c. on his return he brought one of the large opaque globes in which it is proposed to place the lamps in steamer, the armature of No. 14 weighed 212 pounds.

Electric tramway. Ayers drawing more rails for same, and Moffett & Truman commenced work on station, 14 by 18 feet.

Stay pins are being put in all the magnets of the Faradic machines by Porter. The pins are put down through the thinner inside part of the circle in which the armature revolves

I do not the wires. See Book 82, page 217 and 18 for the whole things were

and a line represent the stay pins

Cam feed automatic machine for cutting wood loops on which Batchelor and Dean have been at work for a day or so. finished and tried but found necessary to make some little alteration in the cams Mr. Edison made sketch, of the completed machine, which is attached hereto.

Air Blast Find on Mr. Kruesi's desk a sketch by Mr. Edison of the following, all on one sheet, which I date April 20.80 and signed as witness. Blast for experimenting on separating sand. Pump or Pump apparatus for exhausting the air from bulbs. Wood block milled preparatory to sawing or cutting off the loops. And an apparatus Arc Lamp which I judge to be an arc lamp with electric engine attachment for working the cutter

which Crosby and Hipple are experimenting on by order of Mr. Edison, obtaining their blast by hydraulic pressure.

Meter test Lawson & Mott run wires from two Daniells cells in Balance room to glass house. thence to engine room thence to room now used for telephone, thence return to Balance room. for Meter test purposes. they having placed in the line four voltameters one in each of the rooms mentioned.

Pump. Dr. Moss in his pump experiments has ascertained that it is necessary to pass 250 pounds of Mercury through his pump in order to obtain a perfect vacuum.

Flint glass trial by Holzer for the inner lamp tubes it remains to be seen how much the percentage of breakage will be reduced by the use of the flint glass rather than the common glass heretofore used.

Car couplings. Att making patterns for castings for couplings for car of electric tramway

American Machinist report. Mr. Clarke furnished letter on article in reply to report made by American Machinist No 72. page 99 to 137.

Armature core. Book No. 79 page 233

Mr. Vauni has made sketch of armature core for Machine 15 to No. 21. inclusive, in which he reduces the diameter at the ends of the core where the wires are tied so that after the canvas coverings are put on the diameter will not exceed the central diameter of the armature.

Opaque lamps. Photometric test of acid treated lamps made, results in one case face. 9½ candles side or edge 5½ candles. in another, face 17 candles & edge 9½ candles, thus edge giving 56% of face. This shows a less difference between face and edge than is usually obtained from the clear or plain glass lamps Book No. 82 page 215

Street Lamps. with plough and shovels the ditches, for conductors to the Park, Street lamps were commenced to day, first passing through a couple times with plough and then cleaning them out by hand.

Meter. The electric meter placed by Lawson in the Balance room was found to have disconnected by the copper strip leading from the wire to the shut, having taken off at the surface of the liquid solution.

Pump consisting of but one tube intended to answer the purpose of the Sprengle drop and guage, is being made by Bochm after sketch in Book No 68 page 45

Safety Catch, Mr. Upton is experimenting on lead wire for use as safety catches on Steamer Columbia also on neat and convenient holder or connector for the same.

Yesterday and to day Mr. Clarke has been in Newark collecting data on steam and engines and examining into the merits of quick motion engines.

Chloroform Mr. Edison states as a fact much to the surprise of Messrs Clark Upton and others, that Chloroform would not burn but on the contrary would extinguish fire.

Willow here during the afternoon.

April 22

Flint glass. On April 20 Hofgin sealed platinum iridium wire in small tubes of flint glass, ten in number, which were examined to day by Flammer and pronounced entirely free of cracks, and the best glass yet used for that purpose.

Small Dynamo. Mr. Krenn made last evening for dynamo arms to be 18 inches long by 3½ diameter & 5/8 in armature, patterns for which are being made by Ott.

Platina wire lamp made for experiment by request of Mr. Upton, which gave about 1/8 candle power before vacuum on 5 Daniell cells, but was melted down by Mr. Edison on pump before the power in vacuum was tested

Pump. The single tube pump made by Porter yesterday was started by Dr. Moore and he has succeeded in getting a good pump vacuum in 17 minutes and the pump appears to work quite satisfactorily. Francis also at work with the pump but so far as Porter has not timed it or obtained any data as to its merits.

Electric Locomotive. Breach making Patent Office drawings of the various separate parts of electric locomotive and the same as a whole, from sketches by Mr. Young.

Motor. The generator previously placed in the Laboratory was run to day as a motor and found to heat in the journals to a very appreciable extent. I think the test was made to ascertain whether the journal heating was entirely attributable to the machine generating electricity or whether it was partly

due to friction and belt strain.

Safety clutch. Mr. Upton devised and had Andrew Marling, safety clutch, concealed in box shaped device made of wood, vulcanized paper, or other non-conducting material practically non-combustible or such as would burn only at much higher temperature than that reached by the melting or burning off of the clutch. Two metallic conducting straps or bands 1½" pass across the box, with main or leading wire to be attached either by screw pressure or soldering thereto, and clutch wire, a, composed of lead or lead and zinc or other conducting metal easily melted, connected to the straps by screw pressure. The whole forming a neat, trap, designed for use on the Lamps of Steamer Columbia, but applicable wherever a safety clutch is desired.

Blast Pipe. Lately attached a two inch iron pipe to the blast box or trough leading to the furnace, carried same up into second floor of Laboratory, for experiments on sand separation, but so far as tried tonight, did not give good results.

Prof. Rowland's demonstration of the power of the carbon loop of Edison Electric light has been today compared by Mr. Clark with his method of finding the same, and finds that although their methods and formula differ, they get same results through their different channels. See Book No. 72, pg 188.

High Speed. Mr. Corliss, Manufacturer of high speed engines, of Providence, was there evening; and by demonstrations of his thorough knowledge of the subject, still further confirmed Mr. Edison's belief in high speeds.

Dynamometer. The pressure of steam in the boiler and engine was reduced down to 10 pounds and steam taken in full length of stroke, to see what effect it would have on the steadiness of the engine and on the Edison Dynamometer. but the difference if any was not appreciable.

Telephone. Several boxes of telephones packed and shipped to day.

April 23d 1880

Columbia. Mr. Upton and Cunningham went to New York, carrying with them some of the lamps and lighter parts of glass globe, to set up the dynamos and fet up the Columbia.

Apparatus for playing out the conductor for Park Street Lamps. composed of three wheels and a reel arranged on planks secured to wheelbarrow. intended to straighten and stretch the wire while being run off.

Telephone Receiver. An device fitting up telephone receivers air tight, by putting packing around the diaph. arm or cylinder and in other ways, that they may resist the action of the atmosphere, particularly in

hot and dry climate, when the tendency of the chalk is to dry out quickly.

Pump. Bochm made at request of Mr. Mau a double tubed pump (one tube within another and larger one) arranged with for lamps on bottom and dryer at top where the lamps are usually placed. Book 68 page 51. He also made according to his own idea a single tube pump quite similar to the one experimented on by Mau Book 68 page 53.

Dynamo. Mr. Kunzi made sketch of Dynamo, Book 56 page 67, arranged for being secured on floor or base with one arm or magnet above the other, parallel therewith, a good device for generator for trench or cars, or where any jar or [illegible] might be [illegible]

Tramway Station. Mr. Haring made design and sketch for dynamo station especially adapted for electrical tramways, and to control the movements of trains &c. from one point. Also sketch and device of annealing machine for glass blower.

Conductor boxes, being treated with a thick coating of gas tar, to enable them better to reject moisture and as a preventative against decay.

April 24

Columbia Upton and Cunningham in River Cook again on Columbia and got in the evening two of the generator running, but not large enough to test them any more than to connect one lamp to them at the machine.

Pump by Frances again up and running with lamp on, and got vacuum in two hours. We had attached a device for flooding and removing the mercury from the lamp cup or holder, made with small piece glass tubing attached on side of cup about one third down from top, to which is attached a short piece rubber tubing running and attached to a small reservoir, bottle or other receptacle, by the raising or lowering of which the mercury is forced in or drawn out of the cup. The rubber

cork or stopper in the cup is cut sloping so as to deprive the mercury on the low side at the point of connection between cup and tube.

Hydraulic Press pump bills come put on connecting pump with dynamo motor in Laboratory and run it for some time not however doing any work with the pump.

Journal in which to keep time records and diary received to day and some of the preliminary work done in same

April 24

Columbia Upton and Cunningham in New York again on Columbia and got in the evening two of the generators running, but not large enough to test them any more than to connect one lamp to them at the machine.

Pump by Franck again up and running with lamp on, and got vacuum in two hour. He had attached a device for flooding and removing the mercury from the lamp cup or holder, made with small pieces glass tubing attached on side of cup about one third down from top, to which is attached a short piece rubber tubing running and attached to a small reservoir, bottle or other receptacle by the raising or lowering of which the mercury is forced into or drawn out of the cup. the rubber

cork or stopper in the cup is cut sloping so as to deprive the mercury on the low side at the point of connection between cup and tube.

Hydraulic Press pump belts were put on connecting pump with dynamo motor in Laboratory and run it for some time not however doing any work with the pump.

Journal. in which to keep these records and diary received to day and some of the preliminary work done in same.

April 25.

Pumps. Holzin made six additional pumps of same pattern as one in use in dark room by Francis with new cup flooding device, and put on frame with long slots in bottom and wooden slide fitted therein movable up and down and to which is attached the tube receptacle of the guage measuring-

April 26

Absentee, Mr. Edison and Clarke in Newark in fulfilment of appointment made with Mr. Porter on April 22d. Krewsi, Upton, Pace & Cunningham in New York on the Columbia, and tried the generators and lamps, by loosing control of the engine. The armatures were run at a very high speed, judged to be 1600 or 1700 Rev. per minute. and one of the armatures was damaged by a screw so that they brought it with them in morning to have it rebabbited and fixed. They also brought some of the lamps which were both too low and too high resistance.

Annealing machine device by Herring is to day being made Endure.

Pump Bohn started pump in Glass house and claims vacuum in very short time, with no lamp on.

(Insert. Autographic from pg. 115 – date 28.)

Water Pipe leading from Pond had become so filled up and dirty that Mr. Ford attached water pipe and is forcing water back through it carrying out quantities of mud & dirt.

Cleaning Mercury Dr. Moore is experimenting on some mercury that by accident had got fouled with grease. he had made by Boehm a reservoir in which he put the mercury and covered it with water. and by an attachment on principle of Sprengler pump worked however by water, he kept the mercury agitated by the air seeking its way through it to supply the place of that taken out by the pump. he afterwards heated it and evaporated the water, then kept it agitated by shaking after which it was tried with

acids, he had not finished the cleaning up to evening but had the mercury in much better condition than before.

Hydraulic Press. Pipe connections of Pump and Hydraulic Press completed and Pump working by Dynamo, electric motor in Laboratory, with good field on the pumps against a pressure of 1000 as indicated by the Hydraulic pressure guage, being, I believe, all the pressure required of the air chamber, and all the power required of the pump motor.

Columbia Elgin Face and Cunningham site at work on Columbia, during the afternoon and evening a reception is being given on board of her and all the people here who were fortunate enough to receive invitation cards are down. Mr & Mrs [illegible] going down at 8 a.m. tomorrow.

Armature. The first one wound by Louis Freed was finished by him today. He also unwound the injured wire of the one wound at the Columbia. One of the armatures finished some time since but not used, had to have some overhauling by Andrew in consequence of shrinkage and wharping of the Vulcanized fibre.

Ore from High Mountain Lode sent by J. Brother an bring tested by D. Higgins.

Locomotive Magnets- the magnets for electric tramway engine wound with ten layers of .069 covered copper wire, and put together, one above the other.

Track for electric tramway finished to and around the first bend at first tunnel work.

Pump. Francis claims good pump vacuum on his pumps, in ten minutes

April 28. 1880

Locomotive. Magnets of Locomotive for electric tramway wound with ten layers of .049 wire, were charged and their strength tried. The poles at the base were connected by a block of iron such as used on top of generators and adhered to the magnets so tenaciously that it required the full power of Mr. Krenz to separate one end of the block from the magnet by the use of a short pinchbar bar, a force calculated by Mr. Honig to be equal to 6400 pounds.

Hydraulic Press. The electric motor worked the pumps of hydraulic press against pressure gauge of 1500. Paper was tried between the steel dies previously used on press up stairs and by a pressure of 11 tons, indicated by press gauge, of 11 tons, reduced paper from

.009 to .004 and compressed the paper in the still. A piece of white Holly one inch thick by 3 inches square and by an indicated pressure of 2½ tons was reduced to 5/16 in in thickness and was as solid and hard as bone.

Frictional resistance. In furtherance of Mr. Edison's desire to learn the actual frictional loss on belts and pulleys, journals &c. Mr. Clarke is having made a calorimeter to measure the energy lost in journals of the armatures.

Lamp protection. Several of the lamps on the Columbia having been broken by jar from pounding overhead. John Ott to day made three spiral springs by which lamp stand may be attached to ceiling or any structure overhead and it

was found that semi pounding would not jar the lamp sufficiently to break the carbon.

Autographic. Last Monday night Mr. Kinney got the New York and Philada wires connected so as to have the full circuit of about 175 miles and got very good and encouraging results on the autographic.

Conductor boxes. The wooden boxes in which to run the conductors to the street lamps &c. are being laid down.

April 29.

Wood loop cut from the thin wooden holly milled by Face and cut after manner and in same fashion used for card board, carbonized by Van Velzer were measured and put in lamps ready for pump resistance 125 and 194 ohms.

Pump. Mr. Upton finds the largest Geissler pump in use in dark room to run from 12 to 13 lbs of Mercury per minute. and comparing the small gauge used thereon with those used on pumps up stairs finds them to compare very favorably and equally sensitive with them.

Dr Moss put up a double Springler or combination pump, but has not yet given it a very thorough test.

Hammer attached four lamps to one pump and noted the time required to seal off and was ready to do so in five hours, a very good showing inasmuch as it frequently takes that time to get vacuum on two lamps. He has also been burning for several days a lamp with low vacuum to test the relative value of medium with and higher perfect vacuums. so far the lower vacuum shows equally as well as the higher.

Cleaning Mercury: Dr. Moses has been continuing experiments on cleaning mercury; particularly in removing zinc, and had arranged, a pipe about two feet long and two inches diameter with a smaller pipe attached at right angles. the larger pipe

was secured to the large Lathe, to revolve in manner while the small pipe extended out ~~long~~ parallel to the bed of lathe, the mercury which was placed in the large pipe and secured with good stoppers was kept in constant agitation by ~~the lathe~~, being forced from one to the other end of pipe by the action of the lathe, could not learn the effect on the mercury.

Wood Milling Mr. Batchelor and Dean who have been at work for several days on getting up came and perfecting machine for milling wood loops. got new came in to night and got much better results than by their earlier effort. and by very slight change they will be able to test the utility of the machine for the purpose intended.

Conduit Boxes Ayer All day drawing from Depot the boxes for conduits about four miles of which are required.

HOLLY April 30. 1880. HOLLY (L.S.S. 5/5/80)

While Holly one of the white holly Carbon lamps (regular form) put in lamp by Flammer was wheeled on pump in dark room. gave a very nice light but the lamp leaks considerably

Field Dynamo. John Ott making patterns for small dynamo that may be used for field in case where but few generators are necessary, such as for Steamer, factories, &c.

Brush holder. Cunningham making patterns for right and left commutator brush holders.

Lamp mould. The cast mould in which to blow the larger bulbs or globes of the electric lamp. finished up by Bradley and is being tried and experimented on by Hobgen, has not yet [illegible]

Columbia. Several styles of device for relieving the lamps of undue jar, have been made and tried, using springs of various numbers, sizes, and ways of attaching them, but do not find springs as durable as thick heavy soft felt which is being used in several forms, and giving the best results.

Andrus is making switch board for the steamer,

Tramway. The rails of electric tramway are spiked down as far as the tie will permit of. Between one and two hundred tier being still necessary to lay all the rails on hand.

Indicating. Mr Clark practising and testing with indicator.

Porter here detailing the nature of the work required of [illegible]

[illegible] by Mr Edison

Armature which has been brought back from Steamer Columbia having been repaired was to day shipped back.

Clamps and roller combination for rolling wire in flat and switch shape for wire drawn by Mr Barbour and another a drawing making into clamps, the clamp is of about the same shape as those heretofore in use but of less metal and lighter. Book 51 pages 119 &c.

He also instructed Wm Wright to try nickel for clamps and conductor for lamps.

Lamp conductor. Men commenced laying conductor to Street lamps commencing at generator room with six strands of No. 10 wire four each line running along the tramway and reducing to five wires about opposite the bond.

after the wires are lain in the brass
plug are entirely covered with gas tar
and top varnished on.

Mr. Lawson commenced line of experiments
to ascertain whether or not the rolling
of copper plate injures the surface
of the copper to an extent sufficient
to cause unequal deposit thereon
in the vats.

Journal calorimeter Mr. Clark made dia-
gram of calorimeter to measure
the energy or power lost in journals
of the Armatures and requested Mr
Andrews to make same. Book 72
pages 145 &c.

Switch or Plug board and wheel for
forming and breaking ~~circuit~~ ~~contact~~
to the small magnets used for

imparting a lateral motion to the
Armatures are being finished up by
Cunningham for use on Steamer
Columbia.

Boiler Mr. Wood opened and cleaned out
the boiler of engine for the first time
since he has been here, but found
the boiler quite clean and in much
finer condition than might have
been expected.

Hydraulic press is in practical use in
pressing wood (to about ⅓ original
thickness) ~~for use~~ to cut on the saw wood
milling machine for use as Cooper.

Mercury cleaning. Dr. Moore finds by experiments on mercury that by laying a copper plate on the amalgamated mercury and covering with sulphuric acid, local action is set up which causes the amalgame to separate and leave the mercury clean and pure.

Pump. John Ott taking one of the pumps from Davis room apart and carefully taking dimensions of the tubing and all parts ~~thereof~~ the pump. and making full sized diagram of same for use by glass blower, that they may make a number exactly of precisely the same size, caliper, &c. to ascertain whether they will give equally good results, and will be put in old factory and thoroughly tested as the pump.

Cam, fed. wood milling machine is being run of wood pressed by hydraulic press on Saturday. and turning out very fair specimens.

Calcimines finished. Andrews having completed for Mr. Clarke the calcimine around the bearings of Armature journals, he assisted by C.P. Mott, made the commencement of a series of tests to be made to learn the amount of energy lost by friction in the armature journals Note Book No. 72 page 148 &c.

Car The frame and heavy castings of car for electric tramway were received and men set at work placing the motor in position on engine frame, and at other work at fitting them ready for track

Old factory. Along Rail road is being cleaned up and repaired preparatory to putting in pumps and lamp manufacturing apparatus.

Absentees. Henri Upton Force, Cunningham and Dahl in New York fitting up lamps, switch boards, &c. on Steamer Columbia.

Wood Lamp Lamps. Some lamps of wood carbon were measured and tested by Mr. Ulstrand and he finds these so far made, to be uneconomical, considered due principally to the ragged or feathery surfaces: the lamp with paper cut lamp gave 7½ candles aka same down to 60 ohms hot - 130 ohms 63 - unpaged.

Lamps. Att making very light lamps of copper. Flammer of Edelna, to be tried in experiments with different mixtures for damping. Flammer mr very light Edelna lamp. aimt me third the weight of those pentstone made, in a lamp which was taken off the pump in fine order.

Chinese, preliminary work on the set or series of pumps of Mr. Ayrton and Dimmer of me Mitchell and Drawing by Att, was commenced by Brown. Making

part of 476 gauge reservoir, see order and sketch of Mr. Edison Book 68 page 85

Mr. Harris making diagram of new pump to be set up and used in the factory for handling the mercury for the 476 pumps to be put up there, in which they are putting down Fort Lamp Moulds. The metallic moulds for lamp bulbs were received on a permanent iron case and arrangement with spring to open and cool and fully made for closing to work very completely. Called here with two samples of lead glass tubing, and took with him one of the globe moulds by Brehm as models from which to make wooden moulds.

~~Continued in~~

Amalgate Mercury. Dr. Moses amalgamated a quantity of mercury with one per cent of zinc, to experiment on its ability to electrolyze, and simply stirring.

Circular sieve. Crosby made circular sieve in graduated sections to separate sand in uniform parts for further experiments with air blast separation.

Conductors started direct from Salem with twenty five strands to each line.

Preliminary Calorimeter test being continued by Clark

Mercury. Amalgamated yesterday by Dr. Moses was found to have purified itself by electrolysis. He to-day amalgamated a quantity with zinc, lead, and tin with from one to ten per cent of zinc one per cent zinc electrolysed in about two hours.

Clamps of Nickel, copper and platina made much lighter than the old one were put in lamps and one lamp with light platina clamp was exhausted, fused and by Mr. Edison brought up to intense heat and light and stood beautifully.

Frictional calorimeter test of the ~~of the~~ energy lost by friction in the journals of armatures finished and computed by Mr. Clark. In one test of the journal next to commutator he found it to consume 900 ft pounds

in another test of same bearing found 1040 ft. pounds consumed per minute - Book 72, page 189 K.

Cam Feed. Machine for cutting the outside of the wood loops on which Mr. Batchen and Dean have been at work for three or four weeks was finished and is being used to day in cutting the outside only, and is very complete for that purpose; other cams being necessary to allow to work the inside of the loops, and they are now at work on them.

Opaque & crystalline globe. Lawson experimenting on coating surface of globes with crystalline by fumes did not find find the process so reliable as the acid bath hitherto used, but tested oxalic acid to complete the experiment.

Pumps. Hammer informs me that he alone took twenty seven lamps off the pumps yesterday upstairs and considers it as quite an achievement.

He had observed that the Shungle drop pumps more frequently broke or cracked at the point where the drop strikes the solid mercury column, and on having a section of the tube cut out at that point and examining it, found it contained innumerable small cracks and one place where they had apparently combined and formed larger cracks not entirely through the tube but sufficient to greatly weaken it and show that the constant hammering at that point was the cause of final breakage

Conductors South from Station and all but downhill pipe will be put in day for command house and only taken up

previous to trailing on the screw probably fully as good as the great expense and laborious way of using ~~[illegible]~~ horse, previously hauled inside and out as those first used built from Laboratory.

Visitors A gentleman from Silver City New Mexico came and had with him some wonderfully rich gold ore.

Frictional test. Mr. Clarke made further calorimeter tests of the journals of Armature, using water much cooler than the air, and got one and one half degree difference between inflow and outflow and as a result 1668 foot pounds against 900 and 1000 obtained on previous tests. Showing that the relative temperature of the air and water was very exceedingly the results. But as an average he believes the journal must the commutator to consume about 1200 ft pounds on and on the assumption that the other journal uses 240 or 270 ft lbs. as the two journals use 2% of the energy of three horse power applied to generator. Book 72 page 166 &c.

He is also taking indicating cards of the engine.

Malachite Lawson pressed on the hydraulic press some artificial Malachite to see whether it would be artificial or Nature in condition to be used as the original is. Had not Mr Lawson John Lawson

to give it sufficient pressure but is satisfied from the experiment that it can be done if sufficient pressure is used. Also made a chemical experiment test & could not learn the object or result as he calls it his own private exp. and not connected with the hands in use or in experiment here.

Gang Saws. Wm Wright at work on gang of small saws 150 of an inch in thickness for sawing off the tops of the milled blocks of cam feed machine.

Work general. Dean making tools for wood milling machine, Cunningham and Logan on small Dynamo. Batchelor and Wright on drilling machine. Anderson on gas annealing apparatus for annealing the outside globe at point of connection with inner tube. Dr Moss continuing experiments on the electrolysis of Mummy. Men putting down conductor and others putting down floor in the factory.

Pull backs. Heard Mr Edison to night explaining to Mr Batchelor and others his theory of the cause or point of 'pull back' in revolving armature. his view being that the pull back action is entirely in the copper wire and independent of iron core. and quite fully explained the action going on in them whereby the pull back was caused.

Friday May 7.

McLaughlin. Two samples of tailings from Oroville Cal. were received to day from C. McLaughlin and were being tried by Mr. Edison

Clamps (lamps with) small clamps of copper and nickel were exhausted on pumps to day and heated up and so far appear to stand as well as the larger platina ones.

Moulds. Mr. Horning devised and made diagram of new square nickel moulds capable of holding and carbonizing twenty five loops at once a five tier of five loops each.

Clamp Machine. Mr. Batchelor devised & made diagram of a machine for making the small clamps. Book No 51 page 137 &c.

Contact. Hammer making by suggestion of Mr. Batchelor an instrument or tool for growing copper wire at point of contact with platina wire, to avoid if possible the necessity of soldering the joint it is composed of an iron block in which is made a saw cut sufficiently wide to just admit the copper wire, a light bar of steel about one fourth of an inch in width and of a convenient length is reduced at one end to the width of the slot or saw cut, and on the extreme end made still thinner and wedge shaped, so that when driven down on the wire it forms a groove therein, which admits of the platina wire and may be closed by pressure around them making a neat connection or joint.

Messenger Electromotor. I find in Book No. 80 page 119 a sketch and description of an idea of an Electromotor for use as a messenger carrier
And in same Book (80) page 122 an idea of varying the electromotive-force by speed of engine.

Large Contact. Upton and Clarke working on arrangement of large magnet in connection with engine or motive power, and on the dimensions weight &c. Clarke Book No. 72, page 170 &c.

Saturday May 8.

Tramway. The wheels and other castings for cars of electric tramway were received this morning, and men at work putting them together putting on seats and arranging piping for awning frames.

Clamp Machine. Mr. Batchelor devising and sketching a machine for making the clamps entire, without handling and running through the different machines as has heretofore been the custom. diagrams and descriptions of same in Book No. 51 pages 145 &c.

Annealer. Annealing apparatus for outside globes finished and laid in glass house - vertical - It is composed of a wooden frame, on which a grate is resting

board or carriage ~~rabbet, in a groove or rabbet,~~ at equal distances apart in the board are holes about one inch in diameter with screw threads cut therein and wooden screws cut to fit. through the wooden screw is a smaller hole through which the upper end or rests of the lamp is placed. the object of the screw being to raise or lower the lamp so that the perpper point may come in contact with the gas flame. parallel with and about three or four inches above the frame are secured on each side a gas pipe in which small burners or jets are arranged to throw against the focal point of the lamp. these flames from each side striking the lamp at different points on the circumference. The flames are graduated so that every time

the board or carriage is moved in the proper distance the lamper each time are passed to flames of low heat. The whole is then incased in shutters to retain the heat and keep off the air. see April 23.

Visited Mr. Lowry of E. E. Light Co. with another gentleman were here to day.

Sunday May 9. 80

Engine. Men cleaning and whitewashing walls of engine room. and Mr. Ford took out grate and removed fire brick and also some of the grate bar.

Globe mould. Holgin blown about one half dozen globes in the metal mould, and treated them with the acid solution. It may not require so much skill to blow in mould as offhand and therefore with cheaper labor, but as for appearance and time I think there is no advantage whatever in the mould.

Monday May. 10. 1880

Conductors. Four strands No. 10 wire were run from Dynamo Room to R.R. Station to supply current to the rails. This wire make five circuits from the Dynamos. one of six wires North ~~from~~ one of 25 wires South one of 18 wires west and one of 16 wires East.

Carbonization. Van Choice cut and carbonized some card board loops leaving them closed or connected at ends and found them to retain their shape much better than when open.

Mercury Pump. Mr. Honig calculates 1000 lbs of mercury will be necessary to fill pipes and pump. of capacity sufficient to 200 Vacuum pumps. Mr. Edison decides to run the large Pump with electromotor instead of steam.

Cam Machine is to day cutting inside of loops and finishing them up ready for sawing, three of which were made to day and tried. The operation so far shows a very large percentage of broken loops and the ultimate practicability of putting the loops in the required shape is very questionable.

Mills. Larson put up Meter in line of Dynamo current, to be tested for accuracy with readings of Galvanometer and calculations by Faraday of the amount of copper that should be deposited.

Andrews finished up working model of Electrometer, and

Autographic. Instruments taken apart and all cleaned and polished up by Mr. Kenny. Experiment with the prepared paper was by sliding on

Autographic by laying the paper on tin foil connected to the wire and using other wire on paper. Should marks only when the one pole (owned not till which) was used as marker. changing to the other pole giving no results whatever.

Small clamps. Several lamps with small light clamps of copper and platina were lit up in Laboratory to test them. copper apparently standing as well as any. but Mr Edison observed by close examination a beautiful bluish appearance around one of the clamps and on reversing the lamp the appearance showed itself only on the opposite clamp showing the action to be the effect of one of the poles only. which Mr. Upton for reasons given shows to be the positive pole. and attributes the color to copper vapor. and a gradual destruction of the

clamp and proving that copper will not stand long for clamp.

Visitor. James Egan a former employe of Mr. Edisons with two friends here.

Thursday May 11. 80

Mercury cleaning. Mr. Edison requested Lamont to make an experiment with mercury by coating the surface of impure mercury with chalcophite. A piece of blotting paper was then placed upon the mercury and on the bottom was placed a thin sheet of carbon. Dilute Sulphuric acid was poured into the vessel covering a carbon plate, the carbon and mercury were then connected by a platina wire and set away for a few days. See Book No. 40 page 111.

Carbonization. Van Choice carbonized two monocs of wood loops cut by the cam machine, rather indifferent success.

Elec. Tramway. The road or track for elec. tramway was all balasted and finished up ready for cars, and machine put plug board in station and

Connected the wires with the rails

Large Lamp. Mr. Edison made sketch of large power incandescent lamp and gave same to Mott from which to make Patent Office drawings. The connections being made through mercury in glass tubes. Thomas Sutton similar to apparatus made for carbonizing in vacuum described under April 4.

Visitor Stout of Stout & Van Winkle was here and received an order from Carman for 100 tons of coal.

Absentee. Mr. Carman left for a trip South. expecting to be gone about ten days.

Prony test. Mr Upton making prony test of motor in Laboratory.

Wednesday May 12.

Tramway Motor was connected up and while raised off the floor and testing, found to run like a top. Connections made from Dynamo to wires running to the track.

Tests of Meters in Laboratory were made by Mr. Upton with Bradley methods for studying the principles and making calculations. Book No. 48 pages 53 &c.

Papilio Lawson experimenting on the decomposition of Anthropomorphous Papilio. He first reduced it to impalpable powder. An iron tube was then placed in an gas combustion furnace at an angle of about 60° and when tube about red hot the powder was poured in and allowed to run slowly through the tube. and came out good. Probable that the experiment is for purpose of eventually extracting oil from the powdered Papilio.

Copies of specifications and drawings of part of Mr. Edisons Elec Light-Patents were copied and sent to American Consul at Geneva Switzerland.

Stolen. One of the large Street Lamp globes was taken from a trunk by a brakeman on Penn R.R and by him returned here, the trunk slipping from the train at Metuchen.

Preliminary Statement of T. A. Edison was drawn by Mr. Edison and copied by Motzin evening.

Normal Work Andrews at work finishing up the working model of electrometer. Dean still on wood milling machine. Cunningham at lathe on small Dynamos. Serrell on Electric Engine and gang laying down connections.

Absent. Note sent to New Brunswick to Mr Butler in relation to lamp posts saving Holly. Bill of lumber for Mr Batchen and to do some [illegible] for Mr Batchen.

Thursday May 13.

Electric Tramway. The electric engine was finished and put upon the track. It started off and run slowly with current of 40 volts after which Mr. Edison put it up to about 120 volts and that current gave it much greater power, the test so far as made shown the electrical parts complete and successful, but for nervousness and inexperience, Mr. Herring who was running the motor, threw the friction gear on so powerfully and suddenly that he broke one of the large friction wheels and thus ended the fun for today. We were now putting on belt and pulley gear to further test the electrical application, until they can devise new gear or get castings for to replace the broken one. Late in evening Mr. Edison suggested Martin Force put up connections and for electric incandescent lamps for use in Menlo Park, as he was desirous of making a trial of the electric gas

Electric Lamps in R.R. Station and repair work is being done in them.

Mercury Experiment. Dr Moss conducting experiments to determine the nature of and what if any impurities or foreign substances remain in the mercury after electrolysis, so far has been unable to discover any.

Wood Loop. Two lamps of wood loops cut by Milling Machine were this morning tested by Francis. Resistance and 148 & 152 Ohms. 98 & 104. with 90 Volts and 15 candle power he found 8.5 per horse power, a good showing. They were then hung up in the Laboratory and in afternoon when Mr. C. put up the Electric Motors Francis for the electric tramway, one of them went up. but the other stuck behind.

120 horse power Dynamo. Mr. Clark finished details and diagrams for the large 120 horse power dynamo Estimating weight of Magnets at 1,000 pounds. Zinc bases 1,800 in pounds number and total weight 5.2 tons. Mr. Clark calculations Book No. 72, page 186 &c.

Small Armatures. Francis is winding the armatures for the small Dynamos. with but one thickness of wire, with three strands to the notch.

Air Pumps. A No. 10. Edison Air pump was received and put in use this morning.

Eccentric gear. Sketches of double eccentric gear for application to electric engine dated May 1st. and sketches of several devices on one card made by Mr. Edison and described under Date of April 20. were brought in and put on Mr. Wilbur's book. up stairs

Meter & Motor test Mr. Upton had large meter connected with current of main wires and two small meters on a shunted current to make a comparative test. also made test of motor in connection with meter. Book No. 48, page 61.

Andrews is making small Prony Dynamometer to test the small dynamo nearly completed

Tramway Engine. was fitted up with belt and pulley gearing, and after the belt had been well soaped

and clung to the pulleys. The car was run a number of times to the curve and return. and made one trip with nineteen persons on board and on return trip the momentum given by the extra weight was so great that with both driving wheels sliding she struck the bumper in station with sufficient force to raise it and force the end of station out over a foot. one trip was made to the further end of road, but the power was not sufficient to bring the train back up the steep grade and short curve. In evening the men Logan Smith and Adams were arranging for a two foot pulley on extra shaft in place of 1 11 inch one that was on. for purpose of getting more power at sacrifice of speed. The absorbing topic for discussion is the engine and gear for same

Carbonization Several moves of Bark fibre were carefully prepared and formed a firm wood for carbonization, but the wood proved very detrimental, very one ~~having~~ been broken in the moves during the process. Van Ebro is preparing some more for trial

Saturday May 15

Elec Tramway The electric engine was fitted with larger pulley for more power on belt and pulley gears but almost immediately on depending it was discovered that something was wrong about the motor and upon examination it was discovered that a cross had occurred. The armature was taken out and into the shop where Mr Upton and Kleni removed all the wire and found the cross to have occurred on some of the first wire put on, being the extreme inside wire and wound at the shaft. Mr Anderson was immediately set at work on another armature, to have it ready for trial on Monday.

Sketches of different ideas of gearing for electric Locomotive. by Messrs Batchen, Edison Lanzing &c. Bk 51 page 167 &c. Storage principle see page 169 same book.

Tailings Five small bags of tailings were received this morning from Plainville Col. sent by Dr. A. D. Williams. 723 Chestnuts St St Louis Mo.

Carbonization Chas. Flammer prepared models of Bast fibre by cutting the mass of the fibre in rolled ~~[illegible]~~ strips without using wood and got them successfully carbonized.

Absentee Mr. Clark is in New York for purpose of getting from Babcock & Wilcox data and information in relation to their boiler economizer. &c.

Meter tests Geo. Upton commencing a series of tests on Meter Book 48, page 77 &c. ~~Shunts of copper wire and and lamp~~ Silver wire used as shunts. Amount deposited in Meter weighed ~~and the~~ Mean current calculated to [illegible]

Monday May 17

Engine. Electricity Mr. Ford took head out of cylinder of engine to examine clean and oil up. found it all right and in nice order.

Armature Electricity Cunningham and Andrews worked all day on another armature for electric locomotive and the same was put in place this morning.

Tramway after changing the smaller pulley on counter shaft for a larger one the Locomotive was again tried, with very satisfactory results Mr. Coxaard who was here examined some plans with several men he was given over the straight section Mr. Babcock of Babcock & Wilcox also enjoyed a few rides

Pumps Flint glass tubing for the pumps was received this morning and Bohm is at work on them. Also the staves for pumps were sawed the proper length and sent to Butler at Rensselaer for cutting in the slots, and preparing them for the pumps.

Carbonization Charles Flammer cut slots in middle pieces to hold fibres in place in carbonizing moulds. prepared some Bast fibre and out of 12 got ten out of moulds in first call now convincing himself that nickel is preferable to carbon in moulds probably in consequence of containing less air.

Meter tests Mr. Upton is continuing a series of tests and experiments with meters Book No. 48 page 8542.

Absence Mr. Clarke gone to Philadelphia carrying the diagrams and specifications of large dynamo to Porter & Allen Engine Works.

Tramway. The engine with power from one machine made a successful trip the entire length of the road and return. A Second generator was brought out of Dynamo Station and set running in old Dynamo Room to increase the power for Rail Road. The passenger car was then attached and with Nine men on made the round trip very successfully, without accident or assistance, running the return in 1 minute 16 seconds. After which a number of trips were made all with equal success. And all the trials today have been decidedly more encouraging and successful and fully up to the most sanguine expectations with the belt and pulley gearing now in experimental use. The results have been so eminently successful that Mr. Edison and Mr. Batchelor are contemplating extending the track three quarters of a

mile with grade at one point of about 1 foot to every. and adding three more passenger cars.

Quite a number of visitors were brought over the road among others several foreign Naval officers. and those who have been so favored speak of the ride as exciting and pleasant.

Nickel former. the slotted nickel plate in which Bast fibre are secured for carbonizing and the one used by Flammer yesterday with good results. was by him made and detailed in Book No. 57 page 122.

Order for ~~wire for~~ telephonic wire are being drawn and plans across lots to day by Agent. from Machine shop to da Fabian.

Clamp Machine Bradley commenced work on Machines invented by Mr. Batchelor for making the clamps. Diagrams of which may be found in Book of Patents No. 5.

Sparker. Four sparkers such as previously used on vacuum pumps were made to day and exhausted on the pumps to be sent, as I am informed, to West Point Military academy.

Bast fibre (8) ~~Eight~~ Bast fibre lamps are on Pumps to day being exhausted

Wednesday May 19.

Fiber turner. John Ott is making patterns for castings for a machine attachment to lathe for turning down fiber to the required size and full length of five inches.

Indicating. Mr. Clark had glass point. Made on principle of a fountain pen, drawn down to very fine point and ground smooth on oil stone to use in place of pencil in the Indicator and thus avoid the friction as much as possible. A very fine platina wire is used to keep the point of ink free and permit the ink to run freely. He found it to work more satisfactory than pencil. While the cement was being used on the locomotive he took a number of indicator cards from the engine. (Dynamo running but locomotive off he found the energy of the engine to vary from 6 to 9 horse power

and when locomotive running from 2 to 40 horse power.)

Carbonization Van Horne carbonized Lemoine molds of wood loops but with very indifferent results. All of them very linear ~~area~~ crooked and misshapen. One mold in which but one loop of apple wood was carbonized came out in better shape than any other.

Recording Telephone. Mr. Edison requested Bergmann to make a very small and delicate Phonograph for experiment in connection with the telephone. The idea being that the ~~Phonograph~~ ~~the phonograph~~ worked by the motor shall receive and record the message and the recipient of the message can at any time convenient, reproduce the message from the Phonograph. (See same date Vol. 22. Book 81 page 183.)

Small Dynamo. The resistance of magnets in small dynamo is eight ohms. At 1450 Revolutions and 25 volts on field gave current of 16 volts. ~~Internal resist of armature 16 ohms.~~

Visitor Mr. Willer. A Representative of Scientific American and a member of others are visiting the Magnetic R.R. and Mr. Willer getting up Specifications for Patents on same.

Mr. Carman returned from his trip south.

Film Lamps. Four Bach film lamps were made off the Camp in one order.

Thursday May. 20.

Patents Moto finished up Patent office drawings of Locomotive and attachments of Magnetic Rail Way. and were taken by Mr. Willer together with the specifications.

Ores Four bags of Ore from Boulder Co. Colorado sent by E. P. Geer Agent Agamenghs N.Y. were received and tried by Mr. Edison. He pronounce them very rich.

Mr. Upton is conducting experiments to determine the amount of discharge from the magnets of one machine. Book 48 page 125 &c.

Autographic Mr. Kinney has for some time been using the Dynamo current on Autographic. and is today working with excellent results through 4500 ohms wire, and is having very good results through 180 miles of wire of West. U. Tel Co.

Carbonization Van Elux carbonized three moulds of best wooden loops by securing the strips in slotted middle plates he got them out very nicely and in good shape.

Bast fibre Four of the Bast fibre lamps were measured and tested with current of 10.3 volts they gave from 30 to 32 candles and about six per horse power. They were connected to main wires in Laboratory and during the first hour three of them broke in the stamps and glass but the fibre in each instance remained in globe unbroken. Showing the fibre to make ~~as~~ strong carbon but difficult to form good contact with.

Estimates for Magnetic R.R. and Equipments made by Mr. Young, Edison &c. Total ~~for~~ road and equipments 10 miles 30,000
Total working exp. 10 miles $22,275 Rec'd $1.50
page 179

One of the horses whole of locomotive formed contact with frame and made a spark found to have been caused by bolt projecting and striking frame at every revolution. The locomotive was run in and all the high gearing removed preparatory to putting on shaft and pulleys directly behind and on a level with the frame of car.

Friday May 21.

Ore and refuse. Mr. McKinney returned yesterday from trip to gold regions of Canada. This morning Mr. Edison panned some mine refuse, which had been worked by the mine process, and again panned by McKinney, and found quite a quantity of very fine golds still remaining therein.

Armature of large machine is being wound by Logan with single wire for experimental purposes.

Wood Milling. Dean is jubilant over his success to day in working the cam milling machine with complete success and getting out about 100 boxes of Kelly & Lovejoy in excellent shape and in annual case saving them so perfectly that the whole five loops were left joined at the thick end, although loops the machine

have been worked on it for some time with indifferent success. To day is the first Dean has felt satisfied with its working.

Phenomena Lawson used Florence flasks on steam bath for converting cupric sulphide into cupric sulphate by means of Potassium chlorate and hydrochloric acid. After brisk evolution of gas had taken place for some time. A long report accompanied by flashes of light was observed. This action was observed in two different experiments and in one case the explosion had sufficient force to break the flask.

Small motor Mr. Upton making test of small generator wound with three wires, both as generator and motor. As motor it was run at so high speed that the armature burst previous to which the prony had indicated one half a horse power.

Meter copper. Lawson found as a result of experiments of May 1. That the rolling of copper sheets does affect the surface of the plates causing unequal absorption of Meter.

Saturday May 22.

Last Mr Upton made test of some Bast Fibre Lamps and at 15 candles gave 9.8 per horse power Also made photometric test of one of the Ed Card board carbon Lamps to compare the economy and candle power.

Work general. Main House pushing work on pumps. Gang laying conductors to Street lamps. Men men at old factory preparing building for lamp manufacturing. Mr Batchelor on Machine for making small lamps occasionally stopping to discuss gear question for Magnetic locomotive. Men, changing counter shaft and pulleys on electric locomotive.

Visitors. Mr Baily. and also Collins of New York Herald here.

Mc Intire. Sundays Sun reports death by Drowning, of Henry M. Mc Intire a former employe here, drowned at Carnesville Ohio.

Telephonic Phonograph. Electric made and given to Mr to from which to make Patent Office drawings. Mention of which is made under date of May 19. under head of Recording. Telephone

Bondall dynamo burnt in testing as motor having been rewound was to day Shipped to General Instrument

Visitors. Large party of tourists from Europe and Australia. Absent Mr to, home on visit on return Monday Night can learn of nothing new or startling.

Tuesday May 25

Carbonization Dan Cline carbonized a few blocks of wood tops, securing them in the middle pieces dotted and prepared for them and brought them out much nicer than when carbonized loosely in molds. Int Melted one in mold inside that showed no signs whatever of melting on outside

Magnetic R.R. The locomotive of electric R.R. having been equipped with counter shaft and pulleys back of car frame and belts of six inches made one trial this forenoon by Mr. Batchelor Dennis and Fee. They lined the tracks with leather, and at first trial tip went off the lower end of tracks without any appreciable diminution of speed treading the large pulley and depositing Mr. Batchelor on top

of pile of cord wood without chance of accidents to rest on. Now having found both ends of road, think he is solid. The engine was returned and pulley replaced, after which a number of very successful trips were made

leather turnings from tanks

Wood tops lamp tested. At 16 candles 80 ohms cold 50.2 ohms hot 7 per cent power power same lamp at 30 candles 48.6 ohms hot. 5.5 per cent power Francis Foote unnumbered and unpaged.

Pantagraph Andrews making a Pantagraph of hot from parallel arms each three feet from center to center of connecting points. devised and sketched by Mr. Clarke and much simpler in construction and working, than one of Brown's previously used on the engine here

Visitors. Mr. Bailey here this morning and Mr. Edison went with him to New York. Also Safety rail. R.R. Man with a couple friends spent part of day here

Large Dynamo. Tested by Mr. Upton. Magnet 1.94 ohms. Magnet 4 per horse power.
9 volts from armature running 100 Rev per Minute. Book 48 page 197 also Bk 37 page 192 &c.

Wednesday May 26.

Gum & Resin. In completing experiment on removing Gum and Resinous matter from wood, conducted by Lawson and Notes made date of April 9. He found Oak lost 12.8 per ct and Pine 13.37 per cent, the lowest and Rose 38.76 per ct. Mahogany 31.06 per ct the highest. Dried on Steam beats. They were then exposed to the air in Balance Room about 24 hours and reweighed. San Domingo Mahogany & Dogwood neither gained or lost. Orange, Sassafras & Mahogany only lost weight. All others gained from 4 to 20 Milligrams, White Pine gained least and Cinnabola the most by exposure to the atmosphere.

Station. Platform extended all around the R.R. Station. Electric head light and bell put on the Locomotive, Mrs Edison and some of her friends riding on same on returning, probably the first electric [illegible]

Annealer. Andrews at work on gas annealer for outside annealing of globes similar in principle to the one described under date of May 8. excepting the present one is being made round and combines part of both and an arrangement of the one used for inner bulb annealing described under date April 12.

Telephonic communication established between Dynamo Station and Laboratory.

Absentee Mr. Batchelor at New York.

Test Mr. Upton making further tests of the large Dynamo but with about same results as mentioned yesterday

Brush holder. Mr. Islands has completed a diagram of new brush holders designed for the Large Dynamo. Arranged to act independently of each other taking much less room than the style heretofore used. and designed for three on each side of commutator.

Nickel Plates. Van Velzer had Nickel plate slotted to exactly fit the wood loops as milled by machine leaving one end one half inch slotted wide in which the broad part could draw up in shrinking. slots made just deep enough to admit the loop and clear the plaster plate placed on top as straight. this style was found to retain the carbons in much better shape during the process and some more have been made by Flammer.

Old Factory. The Mercury pipes for the Power pump were received today and the tables for glass blowers made ready for the gas fixtures.

Mercury experiments have been continued by Dr. Moses and the method of cleaning by electrolysis so completely successful that arrangements are being devised for working the method on large quantities by means of a large number of large shallow pans arranged so the mercury may be drawn from one series to another until thoroughly cleaned and deposited in reservoir.

Visitor Bailey, Walker & Goodman.

May 27 read over and signed D. R. Carter.

Ore & Tailings Dr. Haid assisted by Crosby is experimenting on economical modes of working refractory ores. And assuring the furnace in c

Pump boards were returned from A. S. Butterick and prepared for pumps except the dimensions for gauge tube and other large tube parts which are being cut on the drilling machine. One of the pumps were mounted and glass blowers all at work preparing the others for mounting.

Bast fibre. Flamme carbonized some bast fibre are originally five inches long and of different diameter to measure for resistance. .080 had 30 ohms. .020-.105 ohms 7.014-160 ohms resistance. These looked perfect shape and fine appearance carbonized in slotted nickel plate tubes 197-2708 .325 ohms resistance. These showing great inequality in conductivity without any apparent cause or reason.

Magnetic R.R. Motor was but little to do but working beautifully. Pick blood by running over a trolley

Glass Blower. Another finished Apparatus for holding and turning the preparing globe glass over gas flame for heating it preparatory to blowing into globes. It is composed of two wooden chains each passing over wheels notched to fit and receive the links, which are notched in the center from the upper side with groove sufficiently wide to easily admit the drawn ends of the tubing prepared for blowing into globes, and allow them to revolve lightly therein. Over two other plain wheels is drawn a narrow belt of canvas or other suitable material which passes under the tubes sufficiently close to raise them slightly off the bottom of notch in one of the chains. ~~the~~ one of the plain wheels is a crank and by revolving the belt is moved along and by the slight friction on the glass tubes causes them to revolve as rapidly

as may be desired. By another crank on the chain wheel, the tubes are moved along and brought at rest one at a time over the blow pipe ~~glass~~ flame and by the revolving belt are made to revolve and heat equally all around after which it may be lifted out and blown and another immediately placed into its place over the fire by movement of the chain, by means of the crank attached to the chain wheel. See May 31

Visitors Mr. Willer, Collins (of Kendal) and a gentleman from South America.

Absent. In afternoon Mr. Willer and Mr Edison took a ride, as I was informed, over to Port Amboy.

Saturday May 29.

Ore & Tailings. Seventeen or eighteen bags of Ore and Tailings were received today from Power dam and sent to McLaughlin. Mr. Edison has been testing some of them. Both op's etc

Friction Gear. Two models of Kapius friction brake and same principle applied in a complicated way to reverse gear were received today, to study this adaptability to the electric engine.

Large Dynamo. The core of the armature of large machine was turned off so the iron would come nearly an inch from the magnet it was then wound with single wire and tested, gave one volt less than when out full and nearly the magnet.

Pump. One of the new pumps was set up and tried with lamp. a good vacuum was obtained and lamp sealed off in two & one half hours. the Moffett is at work hanging other pumps as fast as they are completed.

Mercury cleaning. Dr. Moore informs Mr. E. that by electrolysis he has purified all the mercury, has worked the entire process down fine and is ready to clean up and commence on other experiments.

Work general for the closing week and to day two men preparing the slipway for extension of R.R. Four ballasting and shapening up old track. gang putting down conductors to street lamps 2 carpenters at work in old factory Mr. Batchelor & Force making and preparing to put up clamp machine, Cunningham & Brady on small dynamo. Blair down on pumps. Carpenter, Dry mill

Sunday May 30.

Spirit. The experiment to decompose Mentioned and commenced under date of May 11 was completed to day by Mr. Edison examining the residue then prepared and set aside and found the chalcophoric had neither amalgamated nor distributed the Mercury see May 11.

Track conductor. Having had heavy rain (the first since the R.R. has been built) and the ground wet and atmosphere being very damp to day Mr. Edison had the best rails tested to find the leakage and resistance caused thereby. It was found to have thirty ohms resistance with one cell of battery and a very slight second resistance when Minotti cells were applied. And state that at that ratio for miles of track would lose one half of the current but on account

whatever has been used to insulate the present rails and the loss would undoubtedly be largely overcome by some attention to insulation.

Telephonic Experiment was made on the rails with a Bell telephone. No results or sounds whatever could be obtained with one current but on applying the cell of battery sounds were sent and received through the length of the rails but not very clear or distinct.

Ore & tailings. Mr. Edison is to day much interested in testing the ore and tailings received from Mr. Laughlin and directed Lawson to make certain experiments for removing the coating from particles of gold so they would be readily in a state subject to the action of Mercury.

Monday May 31

Columbia. Dispatch received this morning from Steamer Columbia stating she arrived safe in Rio — and that the Edison light is all right.

Order. The apparatus made for exhausting in vacuum was repaired by order of Mr. Edison, for the purpose of experimenting on reducing oxides at very exceedingly high heat, the attempts to be made both in vacuum and in atmosphere.

Dynamos. Mr. Upton is conducting a series of experiments to determine some of the laws governing the construction of electric generators, and to study the economical proportioning of the same, and for determining the best method of forming armatures of 130 ohms from Dynamos which have from 1 ohm to 2 ohm resistance each 67 commutator bars & alike. The device for carriage of tubes in blow-pipe described under

May 28 was tried by Mr. Edison in the glass house to-night. I find that the intention is to run the machine with power and use several graduated flames instead of one as intimated May 28. and that it is intended to heat only about two thirds when the tubing can be taken off and the balance of heating and the blowing done in the ordinary way.

Over. Several packages of ore were received to-day, some from S. D. Denton Mapot Burton Co. Oregon. And Mr. Edison is devoting a large part of his time in examining and testing and experimenting on them

Atlantic Journal of the Sciences are about to-day, probably "Decorating" as this is decoration day.

Tuesday ~~August~~ 1.

Friction Gear. Mr. Honig during and straying means of applying principle of Rapier Friction Gear to the gear of electric engine and made diagram of a gear combining partially the principle of Napier gear with a shutter and excentric.

Chlorine water. Five Mining men from California were here to whom Mr. Edison demonstrated and explained the methods of cleaning, procuring by and generating machinery in ten minutes that has often before taken days & weeks to obtain. Chlorine water could be made cheaply. Chlorine water could be made and had a battery jar filled with salt and water. (I should judge about one pound of salt and two quarts of water) a paper partition was then placed in the jar and a carbon plate immersed in each water one on each side of paper. The electric current derived from the Dynamo line was then passed through by connecting to each carbon plate. In only few minutes the gas ~~ceased to~~ was quite perceptible to the smell and soon after, the water on one side of partition began to turn green and the water of that side smelled strongly impregnated with gas. The process was pronounced a very simple and cheap one. and the visitors were much interested in the two as bits are suitable to mining interests process mentioned. They were then taken over electric Rail road and their astonishment and admiration was complete also. explained to them a method of employing mercury while using Dynamo in mining parallel

Oxide No. 1. Mr. Moses had a small piece of common carbon about three fourths of an inch long one eighth inch in diameter sufficiently to hold a small quantity of oxide it was then connected to the wires of the vacuum machine and the current turned on, it was kept at bright white heat for about one minute, but the operation did not reduce the oxide. During the preparations the cap or bell which formed the vacuum chamber had been broken so the trial was not made in vacuum by which means Dr. Moses expects better results.

Bast fibre. The machine for turning Bast fibre on which Mr Att has been at work for about a week was tried by him to day but with no success. The Machine is a delicately made Lathe and Lathe bed, with screw feed to be thrown in or out as desired and intended for the fibre to be held taught between stamp attached to ~~mode~~ in which the ends are secured and the knife or cutter made to settle with great speed by light screw from connect shaft secured on table in connection with the Lathe. He is still at work on the machine and will persist if possible.

Sir Dyorama. Mr Edison made sketch of a combination of six horizontal Dyoramas arranged for four bearings. Also sketch of new form of electric governor which increases or diminishes the amount of current by raising or lowering a cylinder insulated at centre at or near the opposite end the insulation ~~of cylinder~~ while graduates diminishes in width. Also sketch

in such manner that in working the conducting one half surface of the cylinder will remain in contact with the brush or spring, through a greater or less space according to the perpendicular position of the cylinder which is ~~regulated~~ varied by the ~~speed~~ working speed of the ground. Both of which were given to Mr ~~to~~ from which he was directed to make patent office drawings.

Old factory. The carpenters at work today finished all present work in the old factory, having made in addition to the pump frame ~~made~~ table for about twenty four glass globes. One double table in centre of room to accomodate 8 on a side and six next outside wall for about same number. Also bench to accomodate five persons for putting carbons in stamps & clamps or conductors &c.

Visitors. Three young men (Swiss) who made the entire journey of the place without making themselves known to any one till a short time before leaving when Mr Henri Lamm one of them to be an electrician with a light and an account of Mr E. and his work in the entire establishment.

Wednesday June 2. 80

Mercury Electrolyzes. Work is making from sketches made by Mr. C. Patent Office drawings of two Machines used for mining operations (in connection with which Mr has applied) both the application of) means for keeping the Mercury in good state by electrolyzes during the time it is being used in the Amalgamating Machines. from suitable electric machines the wires are connected one to the shaft and the other to the sheet iron or other metallic lining of a cylinder or barrell, so that the current passes through the contents of the barrell, probably water and the ore and Mercury intended to amalgamate the same, and by the electric current the mercury is kept clean, as his demonstration in Laboratory shows that an electric current produces wonderful effects in purifying mercury.

Patent. Herald of to day announces that Patent was yesterday granted to Mr. Edison for magnetic ore separator. described under date of Mch 25. wherein magnets are used to change the trajectory of the falling ore or sands. Representation from sections here shewn got from Mr. Edison a description of the apparatus and principle. and the uses to which it can be applied. He pronounced it the most interesting if not the most valuable subject he had received from here.

Pumps. which have been idle for past two days in consequence of sickness of Foreman were to day set at work by Geo. Hill. One Increase of the pumps for the Lamp factory were furnished by the glass house last night and are being repaired by Neffert and Lidia by Nenig.

Alumina Cup to receive alumina was again tried by Dr. Drown. He took cup from the Mercury Vacuum pump and secured to the plate of same, a charcoal piece hollowed out in center to hold the

Allumina, and the whole placed in the hand vacuum pump and vacuum obtained. The resistance of the charcoal however was so great that the current passed rather like an arc or sparks breaking the carbon & throwing and broke and threw out the allumina so that no results were obtained. Mr. Edison directed him to make the recain of carbon reduced to give high resistance only at the point where the allumina was contained.

Eng. Mr. Hoving made diagrams of gear for electric engine using the Marconi electric and wind sopes and coupling it 1 to 5.

Carbonization Flammer fixed up a bellow blower in connection with a Bunsen burner in a small circular furnace to see what heat he could get for the carbonizing models. He got so high that as needed but owing to the weakness of the apparatus, took nearly an hour in obtaining the heat. [illegible]

Water Carpenters are boarding out in Orange preparatory to putting in pipes to obtain larger supply for the boiler.

Lathe New Stewart Lathe received and set up ready for work.

Visitors Two gentlemen from Columbia S.C. were here to day and manifested considerable astonishment at the extent of Mr. Edison's works and experiments, and were particularly interested on the electric Rail Road. they were taken over the road several times and trip being made down in 3/4 of a minute and return in 1 1/2 minute. Mr. Upton then measured the whole of Locomotive and found that to run the 2200 feet of track in one minute the armature would have to make 2200 Revolutions per minute.

Plumbago. Mr. Batchelor had some Plumbago pressed on the hand press in Laboratory for purpose of turning it out in rings of .005 square to make another experiment with that substance for incandescing Lamps

He got one very off very nicely but not entirely to his satisfaction, suggests to have some pressed on the arbor press, and make some different tools from those used in cutting tonight. Proper by compressing it more solidly and cutting it with tools especially adapted he can get better results.

Wood Milling. Dean commenced on another method and device for milling the wooden loops. The inside will be cut by same process as heretofore but the outside will be cut with a revolving face tool and the block arranged on a double carriage and by some of other additions discussed, will be made to travel along and revolve in such manner that the face cutter will cut the wood to the proper shape and thickness.

Rubber. Ben Mercury was used to test the new pumps and it was found so amalamated that the cause was investigated. Dr Mann took some of the rubber lining which had been in use and found it to contain comparatively large quantities of zinc in the inner lining while the outside contained lead.

Cars. Part of the castings for the three additional passenger cars were received to day.

Lamps. The pumps having been sold for some days. the Glass Blowers have given their entire time to making pumps but Hobson is today working on lamps and will probably be delayed in pump making, by keeping the old pumps supplied with lamps.

Friday June 4.

Elec Motive Force. Mr. Wade finished his calculation of the fall for electro motive force in a system of conductors and lamps as established and put down here in the Park. with view of driving means of maintaining the same constant and further calculating the additional cost of maintaining it by feeding the mains with extra conductors at the points where such feeding can be done most effectually and economically. In line of 1800 feet in length supplying 30 lamps of 100 ohms each the decline in electro motive force is from 100 volts at the machine to 87.6 at Last Lamp. and on same line resistance of 100 ohms in first Lamp in circuit is reduced to 3.6 ohms when the 30 lamps are in circuit.

Calculation Book No 46 pages 130 to 145 and 160 to 180 Do.

Large Globe. I discovered last evening that some of the Large globe were breaking in consequence of the swelling of the pine posts due to the rain and damp weather. Mr Vivian this morning sent a man to examine them and about one half dozen were found broken.

Tramway. Bancroft of Boston visited here and having a few minutes was given a ride over the electric Rail Road on return trip. the brakes were not put on soon enough to prevent a pretty severe bump against the bumper and giving us hands a pretty good shake up. but no serious damage was done, beyond breaking one seat and bending the iron coupling between car and Locomotive, repaired and ready to run in about and was run in about one prow.

Hydraulic Pump. A new armature was put in the Motor in Laboratory and connected by belts with the Pump of the Hydraulic Power to prepare for getting

Max pressure on plumbago for Mr. Batchelor's experiment. A wire in each ~~[illegible]~~ each pole of the magnet with the bar was a remedied on one, but it was found that full current very quickly formed wire with ~~bar~~ shape of armature and it was removed to be remedied.

Wood Loop Lamps. Fifteen lamps of wood loop were connected in main wire in the Laboratory room stain for test of their endurance stability

Cars. Two of the carpenters are at work on the frame &c. of the car for which the castings have been received.

Absentee Mr Edison went to New York on 8.00 train returned early in evening. Mr. Edison also went on same train for trip west.

Magnetic traction. Apparatus finished by Mann to test the efficiency of Magnetic traction for giving friction. No thorough test made. Late in evening four balloons were tried but ~~[illegible]~~ not give sufficient current to magnetize the discs.

Saturday June 5.

Visitors. Messrs Lowery and Coddard were here and after assurances from Mr. Edison and Kruesi that it was perfectly safe and free of danger were persuaded to take the second ride on the electric tramway.
We went very well indeed and with fair speed until the curve at Freeman road was reached, where the motor jumped the track throwing Martin Force and Kruesi off and running over the line seventy yards before it came to a stop. No one hurt ~~[illegible]~~ no damage done. In very few minutes the motor was again on track all on board and running.

Magnetic traction. Apparatus for testing Magnetic traction was today tried with current from Dynamo on Magnetic and the increase of friction or resistance due to magnetism was by means of a scales determined as one half horse power. The machine was constructed with Magnets set in journals at right

angles to each other and with the disc face in contact at the apex. The magnet was single, about three and one half inches in diameter and six or eight inches long. On the face of one was secured a disc a shade larger in diameter than the magnet and placed so the edge pressed slightly against the face of disc of other magnet, the latter disc being probably ten inches in diameter and the traction or friction was same at the point where the discs touched, less, I should judge, than 1/16 in equal.

Alumina Experiments. Dr. Moore has been continuing experiments to reduce alumina but has not yet gotten the sensible weight enough to give sufficient resistance to get a very intense heat.

Pumps. Holcomb commenced carrying the first lot of our Kinnard pumps, down to Lamp factory to day.

Work general. During the week Mr. Bachelder

Martin Tree on lamp machine. Also on turning Back Fibre. Andrews on circular annealer for outside globe. Beasley and Andrews on apparatus to try the power of magnetic traction. Glass Blowers on Pumps. Two or three on winding track of electric R.R. Gang on laying conductors. Three mounting pumps. Cunningham on small Dynamos.

Gauge. Lawson had a gauge, scaled to reservoir by Holzer, to determine the increase in volume of water due to the addition of the various salts. Equal quantity of salt give same increase in any volume of water, sufficient to dissolve it. Private exp. further particulars not obtainable from him.

Monday June 7.

Test Mr. Upton again tried one of the small dynamos with about same results as previous tests. He was unable, with 75 volts, to saturate the cast iron bases of the magnets. The inability to saturate is explained as due to the resistance of cast iron in consequence of the amount of carbon it contains. Test was to determine the electro motive force at varying saturation of magnets. Book 4 p. 1

Alumina Dr. Morris having made a very thin crucible of box wood and carbonized it, today succeeded in reducing Alumina to metal from Alumina. The box-wood charcoal crucible was filled between two carbon strips and placed in ~~vacuum~~ pump and good vacuum obtained, the crucible was made exceedingly thin to assume high resistance, and intense heat was given it by the electric current. He is making some more crucibles and will make thicker [illegible]

Ore (?) from near Washington Rock yesterday by Mr. Edison are being examined by him today. Find in the sample tested, a little copper but no valuable metal.

Mercury Pipes. The pipes (iron) for the mercury power pump were cleaned inside and steam forced in and through them from boiler, preparatory to putting in in Lamp Factory.

Brush holder. Mr. Edison made sketches of brush holder for the 120 horse power dynamo and gave to Mott from which to make Patent Office drawings. See also May 27.

Fall of Electro Motive force in Potential. Nine ~~coils~~ of wires of 100 ohms resistance each ~~and~~ representing about a lamp each were made for experiment to determine the fall in Potential or Electromotive force.

Back Filter. Otto having for present discontinued work on machine for turning filter, Braddy has taken up the matter and is making

very simple former and cutting arrangement for getting them out square, and with flat ends for contact he cut out one or two in evening and the first attempt gave very good fibre gauging almost exactly .012 (as required) and gave very encouraging results for first trials.

SAWYER

Savin Lamp. A broken Sawyer lamp was received from some source this A.M. From what has been written about Savin's Lamp one would infer it was similar in construction &c. and a rival of Mr. Edisons Lamp. As for appearance and construction they are about as much alike as a Fuciel and compound double condensing engine. And as much for practical domestic uses, no more than a Brush, or any other complicated intense arc light.

Visitors Mr. Rustar and several others sundown. Fire.

Absentee ~~Old~~ Mr. Edison Sen. left with Mr. Kinzie for a trip in Canada

Tuesday June. 8.

One Twelve bags of Stamp mill tailings from Consolidated Virginia Mine were rec'd this morning. Two barrels which had been expected for several days were also found in the yard.

Fire. Some fire from Penn R.R. are being drawn up to use on electric R.R. for more securely holding the spider ring hard over seasoned wood.

Monsr. Schar Flammer is slotting some metal plates in which to cartonize the Bast fibres from the instruments or machine made by Bradley.

On washing Mr. Edison connected the neck of a large funnel by rubber hose to the water pipe and filled the funnel with tailings or crushed ores and turned on the water for experimenting or washing one in that way. The water being forced up through the funnel it was expected would carry off the lighter parts and fine dust allowing

Potential. Hood run engine late to repair for Ike to make an experiment with the resistance coils he had prepared each of the ten to represent a lamp of 100 ohms. The purpose of the experiment being to determine the fall of Potential. The fall through the ten resistances was from 84 7/10 to 79 7/10 volts and from 16 1/2 to 12 1/2 candle power.

Visitors. Mr. Bailey & Buckler also Diego de Castro Cosme de Chili and consul of his native friends.

Absent. Mr. Batchelor went to New York (Sickness) to meet his sister.

Wednesday & Thursday, 9 & 10 June.

Chlorine water. Moffett made a box with a double wood perforated partition, set about one inch apart ~~between~~ ~~which~~ and space between filled with asbestos for experiments on making chlorine gas or water. In the large apartments ~~built~~ to order was placed common salt and filled with water a carbon plate was immersed in each and current connected. The apparatus worked nicely and gave good results. Same mode of generating the gas and saturating water decided under date June 1.

Pumps. Were mounting and carrying down the second hundred of pumps to Lamp Factory.

Fibre entire. Bradley working still in better perfecting the instruments for working bast fibres.

Absentee. I was absent (at home) during Wednesday and Thursday. Came Saturday 7th. Edward [illegible] with him.

Friday June 11.

Wood Mill. Dean finished and is trying the new milling machine with saw cutting tool. It does not get come up to his expectation and he is not happy.

Magnetic Brake. Mr. Shenni made diagram of application of magnets to operate on double brake like now used on steam Locomotives. To the joint in center of brake arms is secured a mass of iron. above which are secured the magnets, which when charged by the current attract the iron at joint towards them very powerfully thus [illegible] forcing the brake shoes against the wheels. Mr. Edison suggested some other ways of applying the principle and also suggested and explained the power that could be derived from the induction of a copper cylinder in the magnetic field

Bast Fibres. Bradley got out a few Bast fibres which were carbonized by Van Velsor. They came out very nicely appearing as smooth and solid as steel. The former in which the fibres are cut is composed of a split steel bar, with groove in outer edge .012 of an inch deep and of same width when the bar is brought together by pressure. The fiber is first shaved down in a shaver with knife set like knife in a plane, and the fiber brought gradually near the knife by screw which acts against it. The fiber after being thus reduced one way to nearly the required thickness is easy to be placed in one of the groves of the bar and shaved down to each, after which it is placed in the opposite grove and shaved each the other way, coming out perfectly smooth and square and with width and depth for good contact

Annealed. Five round annealers are now in course of construction. The principle being the same as one described under date - May 26. The circular one now being made being circular and the wooden disc in which the lamps are secured is made to revolve so as to bring the lamps each time in gas flame of the heat until it has completed one revolution of the disc when it is ready to be removed.

Magnetic gear. Mr. Edison made a sketch of an idea by which the resistance of a copper cylinder or annealer, to revolve in a magnetic field might be made available as a gear to take the place of a friction or other positive gear. The sketch made by Mr. Edison represents the magnets attached to and revolving with the axle of a running wheel, and a copper cylinder secured to the shaft of the annealer revolving between the poles of the magnets or in the magnetic field. The magnets being charged offer great resistance to the revolution of a copper mass and thereby make a powerful, smooth gear for both positives.

R. R. Extension. Men are at work on extension of the Rail Road.

Absent. Mr. Edison left on 10 o'c train east returning in early evening.

Saturday June 12.

Bast Fibre. Four lamps now made today with bast fibre carbons made from fibre procured by Bradley on New Castle. One of carbons originally 2 1/8 in long & 1/1000 square gave 386 ohms resistance. Two of the lamps now exhausted on the pumps and heated internally by Mr Edison they heated very evenly and gave beautiful light.

Mr Edison observes that the Bast fibre shrinks in carbonizing about 17 per cent against 33 % shrinkage in paper, woods, &c.

Ore Plating. By direction of Mr. Edison, I have commenced experiments on the extraction of silver from ore by rendering them in a state susceptible of being electrized for plating. Some of the ore was taken and enough solution of Potassium Cyanide in water added to make a thick paste of the mass. All was then thoroughly mixed and moistened and put copper plates, connected at the top by a battery, placed therein. The experiment was very successful and a thick plating of silver was deposited on one of the plates.

Scow Gear

Visitors. Painter of Phonograph.

Work general during the past week, Dr. Morse continuing experiments on the reduction of Alumina, and on making carbonized fibre woods, neither with which to conduct the exp. but has had no further success in reducing it. Glass Blower at work on pumps. Bradley on machine for [illegible] Bast fibre. Batchelor Fac. Ass & Andrews on different parts of dynamo machine. Cunningham on small field Dynamo. Hanig on gear for the locomotive Clark on Insane of great economicals maintaining the electro motive force in large circuits and systems. Carpenter on New and a few on Rail Road volumes.

On plating. Mr. Edison yesterday, made further experiments of removing silver from ores by depositing & gas plating. He added to the ore and water common salt. Ammonia is the pole of the battery. It was decided the action of the current would generate chlorine water, which acting on the silver ore would reduce it to chloride of silver and thus in condition to be made available for plating which is also accomplished by same electric current. On examining this morning he pronounced it a failure.

Papers. Sun of today contains an editorial column article on Edison Electric Light. A very fair, and for that paper, a very favorable article. But the writer takes no responsibility for any of the claims, preferring to use Mr. Edisons sayings and declarations, as the basis of the and comments very cautiously.

Shipped New Lathe (Stewart) and two Dow & Crane packs for shipping to South America Antonia.

Bast fibre. Bradley moved with the instruments for cutting out the bast fibre, up stairs in the Laboratory, having cleared up Mr. Batchelors old place for the purpose. He got out in the afternoon about thirty very nice specimens. By suggestion of Mr. Batchelor, Lewis Flammer cut a cross slot in each of the metal plates used for fibre. The cut is directly across the main slot at the end or medium part of carbon, the fibre having a hole through it at that point. The small bit of platina wire is passed through the hole and being thus placed in the cross slot holds the one end from drawing up in carbonizing and the shrinkage being calculated in the length, it is placed in the plate at such point that the shrinkage will draw up the other end to point where said cross slot would intersect the opposite hull, and thus bring it opposite and on a line with each other.

Mr. Upton made some calcs on the Bell

Film Lamps but did not entirely complete the test because of the current being required for the R.R. the lamp will admit of one and a half as much again radiating surface and still give 8 per hour power it is now burning at twelve candle power and about seven per hour power and giving one fourth more light on edge than on face. At that heat however, the liquids vapory appearance prevents testing about one of the lamps.

Our Exp. Mr. Edison took a quantity of the sample from Virginia Carbonized at mines and placed it in large bro retorts the Laboratory and is conducting some experiments on it, with the secret process. The material is said to contain gold & silver.

Exc. One of the new cars with removable side boards was put on track to day and a number of English people being here the train was run a long time and on one trip carried sixteen persons down and back very successfully.

Visitors English Party & Mr Coughlin

Alumina. Dr Moses made device for holding the small carbon crucible between carbon plates lightly held against the crucible on top and bottom by brass springs which also serve as the conductors. He got an intense heat but comes fine writing of the contents of the crucible, the carbon plates between which the crucible was held prevent not to stand the intense heat. and he is now preparing plumbago discs for that purpose.

Best film The lamp on which Mr Upton made tests yesterday was kept at about forty candles for some time this morning: it was then turned on the wires for observations on the vapory appearance around the lamp. but broke about middle of the trip soon after.

Partition Lamps Mr. Carson was of opinion that the carbon was being carried from one side to the other of the lamp directly across and for further investigation he had a lamp made with a bowl shaped glass partition attached between the conducting wires and extending nearly to the top

of the loop at right angles with the faces. The lamp was on pumps but not yet heated.

Gear Mr. Henry devised and sketched a novel gear for attachment in front of motor to climb steep grades. Its motion and action is very similar to hand over hand climbing, being composed of arms and clutches which grapple the rails, and by a cam movement the clutch is released arm raised up and, extended, dropped down on and again clutched on the rail. The arms acting alternately so that one is always clutched and drawing.

Lamp factory. The new pipes which have been cleaned and prepared ready for putting up were yesterday taken down to the factory. Nearly two hundred of the glass lamps are now down there.

Rail Road. The motor was somewhat improved in appearance, by having the wires concealed and the which lines covered with a board to protect them and conceal them. Mr. Pierce was at work laying the track and double track put on, wooden with a wheel and chain and the beads acting as a guide on the outside of tracks front & back.

Clamp Machine. Is now assuming an appearance that indicates its purpose and the manner of its working: the binder and two punches and apparatus for lifting off the finished clamps are now on none being bandaged having yet been tried except the spring device for lifting off the finished clamps which works very nicely.

Copper cylinder. Pattern was made for casting of copper cylinder with which to make the experiment to determine the amount of power in copper cylinder revolving in the magnetic field.

Laying conductor. Work on laying conductors to street lamps has been suspended for a few days. cause delay in getting wire.

Wednesday June 16

Tailings for bags received from Lagard Bros. taken from the Tunel Mine. some of it very rich a small handfull showing light and tin colors.

Specific Gravity. Dr. Moses has Bolton made a very delicate apparatus for testing the specific gravity of metals & ores to ascertain whether they contain metals. It is composed of a small cup shaped pan in which the substance may be placed, joined by wire to a bulb partially filled with mercury above which is a considerably larger bulb containing air and a still above is a long slender tube that may be scaled off at desired. The whole is made of glass and both bulbs are made air tight, on top of the neck is permanently secured another cup similar to one on bottom. The apparatus is then used in water and the mercury in bulb always draws it down to a certain point and by placing the material first in the top vessel and by adding weight sufficient to immerse to a certain point, and then

placed in bottom vessel and weight added in the top vessel to immerse to the same point the specific gravity may be calculated or at least that is the modus operandi of Dr's experiments made to day.

Alumina. Dr. Moses tried another experiment to day in reducing Alumina, using plumbago discs as conductors in contact with the charcoal crucible, the product ~~showed~~ appeared very mealee under the microscope but Mr. Edison thought it was fused Alumina, the plumbago crumbled almost to pieces under the heat. The air coils were opened to admit the air before the carbon and parts had lost their red heat and the instant the air reached the globe & the covering of the pump, an explosion occurred breaking the globe. It was thought due to the formation of carbonic oxide which was ignited by the heat of the crucible

Colonel Mr. Baichen left to day for a trip with his family and sister.

Spectroscopic examinations of the Felix Lamps were made to day by Prof. Young. he got carbon lines in all cases except on the last lamp letter which was the partition lamp with low vacuum. he got two lines of Oxygen. Having been convinced that the vapory appearance and slight deposit on the negative clamp was carbon in some form, the questions arose as to the cause, remedy, and whether the carbon was carried along the loop or passed across from one side to the other. The action being observable only when lamp is at intense heat and current of high electric motor force, these were attributed as the cause. and by discussions it was concluded that the carbon was carried along the loop and not across as was supposed by some. To further convince themselves of the action, an experiment was made by placing a thin copper wire in a U shaped glass tube filled through to obtain the action of the copper and the presence from the

on the first experiment the wire was taken off at the positive connection or clamps and again passed quite thin at about one third of the length of wire or at point where the larger part of the carbons have broken, and depositing of the metal heaviest as it neared the negative connection this experiment showed that the carrying was entirely along the wire as no means were allowed for the current to pass or jump across. Further experiments are being conducted. as a remedies it was suggested to reverse the current frequently, or another to taper the carbon thereby giving it more substance to loose, and permit it to equalize itself. Another was by use (in some way) of magnets and experiments required to be made on the different ideas.

Rail Road. Manley with his men commenced to day working from six o'clock till dark on the track of electric Rail Road and to night made great improvements in the curve and track down nearly to Moffets crossing.

Burnt Prairie Lamp wheeling gum & Rain from Bat

Lamps. The lamp made with glass partition and tested at intense heat yesterday and the one from which the hydrogen lines were obtained in spectroscope was broken in the carbon today. Other lamps were made with mica partition extending down nearly to bottom of large globe. One was shaded on the lamp and heated up. Mr. Baum then for experiment let air in as the gauge measured [illegible] about therefore the globe and turned it at high incandescence for long time the lamp showed all the characteristics of lamp with high vacuum and showed the odoroy like the same as the plain lamps.

Two half length Bartis were gotten out by Brady and carbonized by Van Cleve, to be made in two lamps in series to replace one of present lamps for experimental use.

Magnetic Separator. Hammer placed a glass between the face of the magnet and the line of face of the sand. Claimed it is work better by keeping the magnet entirely free and free of the dropping of the magnets.

Wire Lamps, representation of lamps. The wire left in a shaped tube filled with metal solution last night, was examined to day and found to have been reduced at same point and augmented the same as the first experiment made, and the diminution of the wire in both cases represent the points at which the carbons usually break. An iron wire was tried in a solution of common salt and ferrocyanide, Potassium but no light was thrown on the subject by the experiment.

Poles for telephone wire and connections for current from Dynamo Station to the Lamp Factory were put up this morning.

Our two gentlemen were here to day with Ore and tailings of Dry placer.

Drawings Mr. Haring made sketches, on three sheets of gear and of engine when equipped with the gear, and gave same to Mott from which to make Patent Office drawings and he is now at work on the same.

Magnetic Brake. The magnet for one of the small field machines, made with a soft iron core and wound then layers of .012 wire was placed on one of the benches in the shop and a square iron mass screwed one to each end of core as a base, a bar also of iron was ~~screwed~~ fastened, about one by two inches and 10 or 12 inches long, placed between the base blocks so the surface just touched but not sufficiently to hold the weight of the bar. current was then put on the magnet (about 1/10 of a horse power) and the bar was held in position with sufficient power to hold up a 105 pound anvil. Mr. Edison ~~yesterday~~ almost his entire strength to push it through and could ~~push~~ it through. The experiment was made to test the power of magnets in application as brakes.

Freeman and Dow badly with hatchet off work

Taper Corpse &c. Mr. Edison directed Bradley to select some corpse with various imperfections to study the effect in the light and the stability of them when containing pith, hard outside, and irregularities in cutting. Also to make some with a taper of .005. to be tried as an experiment in the carrying tendency of loops. and to see whether it will equalize itself.

Mica partition. A lamp with mica partition made yesterday, was broken this morning by Mr. Edison on the pump by internal current. Another was made and is on the pump.

Half Lamp. One ~~half~~ carbon just one half the length and same dimensions of the long Bast fibre was put in a lamp and exhausted this morning. The lamp was hung in the Photometric Room, and brought up to 26 candles and left at that heat for some time, it was then lowered and gradually raised to twenty eight candles before this could be observed and then not in lamp but diffused through the entire globe.

The lamp was then gradually carried up to nearly eighty candles and stood nearly a minute before it broke in the carbon. This was unquestionably the finest lamp ever made showing the growing of the Back carbon and opening a new field for experiments.

Mr. Edison made sketches of two of the half lamps (as they are called) in straight tubes instead of globes and arranged in series. Note Book No. 63 page 167. Films are being cut with which to make sections of the lamps and further test their merits.

Gold Ore. Dr. Moss took a evaporating dish and in bottom placed a carbon plate with wooden frame on edge and insulating to the outside of pan. On top of the frame was placed another carbon plate, leaving a space of probably 3/16 of an inch between the two plates. The dish was then filled with salted water and gold ore very finely powdered mixed in. The poles of batteries were then connected to the plates and allowed to remain over night. The effect being to have the current generate chlorine gas in the solution, which will act upon and render the gold which may then be precipitated.

Magnetic Brake. Mr. Ewing made sketch of an application, of the principle demonstrated & described under date June 17, for a magnetic brake on cars. The small magnets are secured to the frame of the car. A cast wheel is secured on the axle so that the outer part may revolve between the poles of the magnets, which are secured by bolts, the bases in slotted holes in such way that they may be kept from contact with wheel by a light spring when not used, but when current is given to the magnets the base blocks attract themselves to the opposite sides of the wheel with great tenacity and thus make a powerful brake. The sketches were given to Mr. Prom which to make Patent Office drawings.

Small gas dynamo. Soft iron core, tested by Mr. Upton.

Saturday June 19. 80

Hot air Engine. The small engine with which the experiments with exhaust steam as feed were made was to day shipped to Delamater Iron works New York.

Electric Generator was improved in appearance by a thorough painting.

Gold Ore. The experiment commenced and reduced yesterday was examined this A.M. by Dr. Moses the contents of the evaporating dish were filtered and the very small quantity of the liquid precipitated by Moses showed gold in sufficient quantity to indicate that the operation had done complete work, the liquid and solids were then taken by Dr. Hardie. Dr Moses behind the experiment shows the process to be economical especially in ores that are not contain too much metal other than gold. Acid in presence of other metals the chlorine would act first upon them and leave the gold till the last time requiring longer

time to do its work than it would in pure gold ore. and the question of economy would to an extent depend upon the time required to complete the process. See June 22

Lamps. Some four or five half lamps were made to day and two in tubes unclean of both put on the pumps ready for exhaustion Monday morning.

Dynamometer directed to be taken off and belt which has to day been repaired by Andrews to be put on connecting direct from main to Dynamo shaft.

Absent Fishing } Mr. Edison and about all the men except some in the shop, left here about four o'clock p.m. to take a Schooner (hired for the purpose) at Woodbridge for an excursion and fish, expecting to remain away until Monday night.

Work general of the week. Several in shop at work on patterns for India gear. Men & Agus team on Rail Road excavation. Mr. E. interested and experimenting on Bat film lamps Bachus also absent. Cunningham in small [illegible]

Dynamometer. taken off and the main and Dynamo connected by direct belt

Half lamp. The tester on of the half lamps of 70 ohms resistance cold, heated to 11 candles dropped to 40 ohms the test was not completed in consequent of the current in evening.

Specific Gravity. Dr Drew has Bottom made another apparatus for testing specific gravity. Shall try in Book 68, page 123

The Dr is good on apparatus (Query if I felt at liberty to express herein my own private views I should remark he is 4-11 on apparatus)

The Old Lava wood was examined this are being drawn by Agent from Dept to use on corner and points of the Electric R.R. One can Lava of which were shortened delivered on Saturday.

Glass Tubes. A Glass Manufacturer from Lowing 2½

Fishing. The excursion returned about 10 o'clock This Evening I shall not [illegible]

Half lamp. Two in small tubes were put up in series at about 45 candles to test their stability, average life about 1 hour at that heat. A single full lamp was then put in rather shorter bend at same incandescence. Three other half lamps were sealed off the pump resistance cold. 67, 69 & 81. the Loops in regular globes. Two were placed on the wires in series at 86 candles and remained 2½ hours before breaking. These gave 5.4 per horse power at that heat or 350 candles per horse power. The survivor was put at 9 candles requiring 2580 ft pounds or 285 ft pounds per candle. And at 8 candles 2020 ft lbs Book No. 48 page 181.82.

The better economy of the regular globes over tubes is probably due to the small tubes, being nearer the glass carbon conducts away the heat more readily.

The new fibres as cut now, are 4 1/8 in long by .012 diameter square, and the small half in length. Bradley is now cutting one [illegible]

Electric R.R. Mr. Edison run the motor around the short curve (30 ft radius) several times to day. On starting from the Station when current was first put on. The Armature of the Reversed Machine. The second one in series, was burned out on examining it it was found that the solder had melted and commenced the cross at the commutator head, and the armature was entirely unwound. A New magnet and armature were put in and connected up. Its test of it has yet been made.

Ore experiments, of Dr. Mees ~~made~~ commenced on Friday June 18. was further examined into this morning by placing the carbon plates used in the experiment, in a solution, to discover whether they had absorbed any of the gold in the solution. The plate connected to the zinc pole of battery was found to contain a considerable quantity of gold, the solid residue examined by Hare also contained some gold.

Office. New Book case being put in today and partition built around the head of the stairs.

Small pin dynamo was tested by Mr Upton as a motor with Prony Dynamometer, which indicated about 19,200 ft pounds. The shaft of Prony gave out before the test was entirely completed. Book Mr. Page.

Bast fibre. Some choice specimens of Bast fibre were brought to night by Hughes.

Dr. Lawson tried an experiment of depositing silver and gold on soft iron turnings by use of battery current. The ore was taken just as it comes from mine, but no results were obtained. N.G.

Power Mercury Pump was delivered at Lamp Factory this A.M.

Wednesday June 23.

Exp. with copper wire in straight glass tube filled with water solution. the current being passed through the wire it was eaten off at lamp on connection with carbon pole. An iron wire in same tube was then placed in evaporation dish with a solution of Salt & Potassium Ferrocyanite. In this case the stronger the solution was the more local was the carrying and on diluting it the carrying solution was for a greater length along the carbon, next the carbon pole of battery.

Edison Lamps. One of the half lamps in free globe was tested at 22 candles. 67 ohms cold. burned 3 hours 18 minutes. Then half lamps in tubes sealed off the pumps and sealed up. the carbon however was so close to tube that the glass was melted. Full lamp was then tested at 40 candles and gave 100 per horse power, and lasted at that intensity for 2 hours & 15 minutes

Carbonization. Mr Ott finished a new former by which to cut the slotted circle plates in which to carbonize bath fibres, and got out a plate or two which were used to day by Van Wien and several very fine specimens of carbons gotten out by him from them.

Small pin dynamo was set up in the dynamo room and belted to shaft of other dynamo. the present pulleys give but 1500 Revolutions per minute, and current only sufficient to heat one lamp to bright red heat. the pulleys will be changed to make it 2500 Revolutions and better results can be obtained.

Gold Experiment. Dr. Morse having formed gold in one tube upon fall of the original solution of experiment mentioned June 15 and also in one of the carbon plates used today by Dr Hall and Crosby. the latter Dr not having found any gold in the solution of the first experiment which he tested.

Nitric Acid. Lawson took some calcium carbonate and made in paste with aqua Ammonia, and immersed the poles of a battery to experiment in decomposing Nitric Acid. After remaining some time traces of nitric acid were found.

Visitors. Parkes & Bailey, two new French gents also Livingston a former employer.

Absentee. Clarke gone to Philadelphia and to examine an instantaneous generator.

R.R. Row arose at the sharp curve to day but the wheel of the commutator shaft cramped against the coupling links so hard that it was necessary to uncouple and shove the car back around the curve.

Thursday June 24.

Lamp factory. Cunningham, Andrews & Johnson commenced in lamp factory this morning by preparing to put up power mercury pump.

Bast-fibre lamps. Small loop at 22 candles lasted 3 h. 13 m. one at little more than 22 candles played 2 hrs. 30 m. longest life in long carbon today 1 h. 12 m.

The most economical was a half lamp and one dipped in Plumbago solution was uneconomical and short lived. The economy varied considerably. Lamps lighted in the evening did not show so economical by from 17 to 20 ft. lbs. per candle as the same lamps did in day time, attributed to the reading of the photometer, as in evening, the resistance read lower and the bottle higher to give the same candles.

Book No. 87. Page 218 Os. mn.

Gear. Some of the men in shop at work preparing the gear castings for the electric locomotive.

Carbonized linen. Dr. Morse appearing to be out of a job Mr. Edison ancors him to analize some of the carbonized linen paper from the Moads. and he is preparing for the work.

Magnetic Separator. Mr. Henry is designing the arrangement of magnets and hopper for a working system of magnetic separation.

Absentees Mr Edison went east on 11.20. Mr Lewis also absent towards Phiada.

Soap. Bradley cut some from Osier willow and some from palm leaf of different sizes and lengths. The willow was carbonized by Van Velsor. but not taken out of Moads today.

Gems. Hidden has today and brought for Mr. Edison some cubes of chrome gems and precious rare stones. &c.

Papers The Scientific American now out of date July 3. contains a cut & discription of Guesto Improved electric Lamp. The improvement claimed being the use of Mercury in the tubes for sealing the platina wires and in of clamping. Otherwise the lamp is a facsimile of Mr. Edisons Lamp. but unnecessarily much more expensive.

R.R. Today run around the curve and back with eight persons on the car.

Tests on Vacuum. One of the pumps was put up in photometric room and a regular paper carbon lamp attached so that when lit it would be in position to measure. At very low vacuum it was heated to 16 candles and, as the vacuum increased the illuminating power also increased to 22 candles without any increase of electro motive force and with very slight decrease in the resistance of the carbon. This test proves conclusively that high vacuo is necessary to best economy.

The battery cells were renewed this morning and the tests today were carefully and accurately made. ~~One test lamp~~ Book No. 42, page 117 to 173 &c.

One Bast lamp that was tested yesterday tested with old batteries and showed badly at 3.45 ft pounds per candle against to day with the renewed battery 3.30 ft lb per candle.

Attention Mr. Clark, N.D. tonight from Phila. [illegible]

Saturday June 26.

Power Mercury Pump. was set up in Lamp Factory, Cunningham Andrews & Schnyder Thru all day.

Willow Loops. The Nine willow loops carbonized yesterday were taken out this morning all broken, very delicate & tender

Bast fibre lamps. One lamp regular size bast fiber, demand 14 ohms in its resistance after heat put on. at 40 candles low vacuum the blue was very noticeable but after high vac. was obtained the lamp was raised to 60 candles and showed no blue. the lamp when first heated at low vacuum, gave 9 candles and increased with the improved vacuum up to 20½ candles on same electro motive force the lamp remained bright after the lamp had broken. Book No 42 page 175 &c.

A second test of a similar lamp 223.

Ohms cold demand is 95 ohms when heated to the increase in illumination as the vacuum improved was about same as in previous test. The lamp was then raised to 44 C. in high vacuum and gave no blue although it showed blue at 44 candles in low vacuum. Tested this for economy. at 14 candles it gave 12.2 per hour power and 74.3 ft pounds per candle when at 64 candles

Book 42 page. 2018c.

Ballast Ten car loads of ballast sand dumped by Penn RR for the electric Railway to day near culvert.

Chlorine Exp on carbon. Dr Morse having found very little if any thing, if the carbonized tissue paper which he had analized by request of Mr. Edison. He tonight. placed a carbon plate in bottom of evaporating dish covered it with a

paper carefully laid a number of sheets of the carbonized tissue together on top the paper, and connected one pole of battery to lower plate and the other to the tissue, covered the dish with saturated solution of salt & water left to make chlorine and that to work upon the carbonized tissue

Work general of work. Mr. Batchelor still absent. Att on former for and getting out sketch plans in which to carbonize Bast fibres. Most of the men in shop on preparing the gear castings for putting on the electric Locomotive.

Three men during day on R.R. painting and Crosley with five men from 6 o'clock till dark. Mr Edison and Upton taking and experimenting with Bast fibre, Lamp. Glass House on Dynamo

Lamp fire in Laboratory. fire Mr. Upton & Mr. Mr Edison & Mr. Mr Upton & Mr. Mr Edison & Mr. Mr Upton & Mr. Mr Edison & Mr. Mr

Monday June 28

Lamp Factory. Mew Gerrelia all day yesterday down at Lamp Factory. Mew on Rail Road.

Absentees Yesterday Mess Edison, Upton and Lelande on to the track. In the Morning Mr. Batchler returned from his trip after an absence of ten days. (since June 16)

Carbonization. Van Eleen carbonized a few loops of soft parous Bast fibre which came out first class, also some loops of Palm leaf which also came out very good. they were all put in lamps and one of each prepared for the pump in photometric room, but nothing done with them today.

Small pieces dyoramo tested gave 90 volts. 9 lamps were put up in Machine Shop and very brilliantly lighted by current from the little Machine.

Lamp. Best fibre lamp made with small double partition between the lamps was tested resistance hot 118 ohms at 16 candles required 192 ft lbs per candle 12 lamps per horse power. Book No 42 page 229 &c.

Chlorine exp on carbons which on Saturday examined this morning the carbon was found to have been affected by the chlorine, proving its impurity and presence of Hydro carbons. The experiment was made then by immersing in solution of each carbons regularly damped to small wires one connected to each pole of battery. the result showed the presence of Hydro carbon same as first exp.

Visitors Prof Barker. Collins of Herald a large party of Havana. tenta. and Bailey & Buckles in the morning Railroad. run for the tentam. Armature of Dynamo Machine again turned out. no same cause [illegible]

Tuesday June 29

Lamp tests. One soft bast fibre carbon regular size very fine at 35 candles Book No. 42 page 25 18c continued in No 103. Another of same kind of carbon with resistance of 790 ohms cold, very fine at 44 candles and lasted about half a minute. Regular bast lamp resistance cold 194.4 ohms was fine in high vacuum at 40 candles. was sealed off the pump in thirty ~~pen~~ minutes after stopping the pump.

Palmetto carbon resistance 115 ohms at 13 candles. put at 44 candles and sealed off after remaining at that heat for one hour. Book No. 103 pg 18c.

Clamp Machine. Mr. Batchelor is again down to business on the clamp machine

Electric Messenger Mr. Edison to day revived the idea of the electric messenger. and is seriously discussing the putting of it in practical operation for our ~~[illegible]~~ lines

as an experiment. and the theme this evening is a discussion of the means and appliances ~~for the~~ and expenditure for the trial. Su also May 7. 1880

Carbonization Van Choe carbonized some bast fibre .005 by .012 & .010 by .010. and got out one willow .012 by .012 which was immediately put in a lamp and tested gave 232 ohms hot. quite fine at about 40 candles and lasted about five minutes. Mr. Upton says it took 71 ft pounds per candle.

Small field dynamo. The magnets of the small machine were wound with 7 additional layers of wire making in all ten layers. .035 It is running at night and furnishing the current for 8 or 10 lamps in the shop.

Visitors Mr. Edison has just from trip in Canada & west.

Wednesday June 30.

Lamp tests. A Bast Lamp .005 x .012. carbon at 19½ candles gave 280 ohms resistance and was a little blue. It was then put at 18 candles which on face of these books is calculated to be equal to 44 candles on the regular book. and broke in about 10 minutes. It took 2810 ft pounds or about 90.5 ft pounds per candle Book 103 page 398.

2nd Lamp same size carbon burned 8 minutes at 18 candles and took 102 ft pounds per candle

Platinoid .012 square broke immediately on turning on the current

Calorimeter and Galvanometer test on paper carbon lamp 87 Volts. Calorimeter 3810 ft pounds and Galvanometer 3920 ft pounds. Book 103.

Sonnaz field dynamo again taken apart and the two one half layers of .021 wire wound on magnets. Winding done up and [illegible] Lamp [illegible] the main [illegible]

Capillary Traction. Some question having ~~arisen~~ been raised as to the effect of the size of the gauge tubes on the reliability of the readings. Bochm made a U shaped apparatus of glass tubing one side about one eighth of an inch bore and the other side of about 3 mm of same gauge tubing and put in mercury. the mercury stood in the large tube about ⅛ of an inch above that in the small tube. (showing much less difference than was expected).

Stop cock. Mr Andrews devised and made a sketch of a simple and easily managed and constructed stop cock for use on the mercury pipes leading to the vacuum pumps. The principle is to have a rubber cylinder or valve worked by a screw and to press squarely against the direct flow of the mercury, by conducting the mercury from the main pipes at direct by openings in the side and [illegible] the right angles with

The main pipe into a reservoir in which is wooded the rubber valve or disc by the raising of which both the inflow and outflow holes are opened and by securing the disc down under the bottom of reservoir the flow is diminished and when secured down firmly the flow is stopped entirely.

New Mineral Dr. Moses claims to have discovered a new mineral in some ore sent here for assay from California as described by him, it resembles in appearance chromite but differs from it in its chemical composition and in details

New Mould or carburizing furnace was devised and sketched by Mr. Batchen. It is a nickel box of size sufficient in depth to hold 30 sketch plates, the bottom of me running as a conveyor to lead

for the new furnace. each entire plate in this way requiring about 1/8 of an inch. The plates are only large enough for one loop at a time. and the box or mould filled with the plates is designed to be used in a gas furnace which will be devised especially for the purpose.

Visitors Lowery. and a friend and Mr Philips

Adjourned Mr. Edison went East (probably to New York) at 11 30 and returned at 5 30 with Lowery & friends.

Thursday, July 1. 80

Conductivity of film carbons, illustrated Book 103, pge 68 etc. Manilla .005 diameter by 2.4 inches long. 505 ohms resistance area, or 5.205 ohms per mil ~~foot~~ inch. Bass .012 by .012 square 195 ohms area or 7.099 per mil inch. Palmetto .012 x .012 square 5.207 per mil inch.

Electric Messenger. Mr. Edison directed Strong to draw and make diagram of a Stanton gearing expressly for spring arm as light as practicable to be capable of 200 miles per hour for messenger.

Andrews at work on the superstructure of track to be carried around a circle of 1000 feet diameter to make an experiment of the utility of the invention.

Lamps. During the day, six of the lamps in the shop run by small dynamos have broken, four in the glass and two only in the carbon. The carbons remained [illegible]

Gas Works for Lamp factory started out by Mr. Krewis and Agnes commence drawing down brick for new therein.

Armature. Burned out the other day while running the railroad. Dec 29 Replaced the coils replaced with fresh wire and tested ready for use.

Works. All shut down at eight o'clock to give them so inclined, an opportunity to go to Orange to election of School directors.

Gas furnace. Mr. Batchelor is today designing and making diagram of a gas furnace for carbonizing.

Friday July 22 1880

Pumps. The glass blower finished the two funnels of the pumps and men have today been carrying them down to Lamp Factory.

Four lamps were attached to one of the pumps today and after excellent vacuum had been obtained. Mr Edison was showing the pumps to Prof Barker and F. Thompson of Penna Rail Road when the mercury for some unaccountable reason flowed up into the lamps entirely destroying the vacuum and two of them lamps. Four others were then attached and after breaking the vacuum and admitting air, after breaking his face

Wood Miller Dean today is trying to finish his face cutting attachment for the lathe for working wood loops it is a very complicated mechanical piece of delicate and compact machinery but too incomplete yet for an attempt at description.

Crucibles for Assays. Cunningham finished a mould in which to pour suitable material into form for the small crucibles which

are used in the final process of assaying and tried it several times with chalk it worked very nicely and he got out a few very perfect specimens. The mould is made of iron, composed of a base in the center of which is a round cavity piece to form the cavity of the crucible on top is placed a cylindrical part with hole through the center, widened near the bottom into shape of round or upside down funnel. Plunger are fitted very snugly to fill the hole, or bore and after the material is placed into plunger an asphalt block and pressed down in the bore, the base and cylinder being separate but nicely fitted together and the one lifted from the other leaving the crucible easily removed.

R.R. Station Martin Force removed the platform from the end of Rail Road Station. Changing the wire connections to one side of the building preparatory to remove the end of station for continuation of road.

Magnetic Separator. design for the manner working of the magnetic separator was completed and sketch of the same given to Mott from which to make Patent Office drawings. Capacity and specification in Book No. 80. page 200 Pen

Lamps & Magnets I find in Mr Upton's Book No 103 on page 275 quite a descriptive list of experiments requested by Mr Edison to be made on platina wire in air and vacuum, also on the to determine whether an active armature contains any magnetism. and some other.

Loops. None but regulars have been cautioned today, but Bradley has gotten out some more of the Calcutta loops and was directed by Mr Edison to set, on the same former wire for back, some out of Marble glass and board and also lay up attach some of which I got for him.

Visitors Mr Willey, also a Mine Proprietor of Gladwell, Cal.

Saturday July 3. 80

Summats of Armatures. Armature to day has been coming out the inside of the brass force of armature bearings and coming in them Fabric bottom.

Ore. I Wallace received the Drawing from Rock Mass and Mr Edison was found to contain notes the same as found in Massachusetts process.

Lamps. One of the lamps was taken out and the connection between the lamps also the and the carbon wire broke.

Blade. Lamps and clocks (to Arrange for engraving on setting for barage on forming a portable stuff cover of the room from any case of the vacuum

Selection with the carbon wire and lamps)

Station. The end was taken out of the station in separation of extending the track and doing away with the bumper.

Magnetic brake. Logan put brass wheels on the axles of one of the cars and turned

Obituary. Notice of Edwards death to be written

and polished them, preparatory to putting on the complete trade.

Locomotive, Lamp Electric for ~~[illegible]~~ reading, was roughly sketched by Mr. Edison. The armature is shaped made on a shaft over the driving axle and second shaft by electric I shown page the propose to be to get high speed with very simple gear.

Pullman Palace Car, was put on track this last noon.

Rail pattern. Cardano ~~[illegible]~~ making the pattern for the elevated Brooklyn road (The cross section of the rail would pretty well represent a capital Z inverted S)

Drawings. Magnetic trade applied to Brooklyn Rail Road car was made by Mr. Edison and given Mott from which to make the drawings.

Galvanization. Mr. Edison was applied on a solution of Ammonium Sulph. & Zalumen and one in Chloride in Alcohol and other dipping was recharged and came out fine.

Work general of work. Mr. Sachse at Shop on Beam's Machine. Mr. Edison & Upton testing lamps and experimenting on carbons. Pumps power put up in Lamp Factory. Wires on R.R. extension. Lines in hands on Gear of electric Locomotive. Glass blowers on pumps. Carpenters on Car & Electric Wiring &c.

Wednesday July 7. 80

Note On my return this morning to my post of duty after an absence since Saturday afternoon, I find.

Brake and Light Application } I find by Mr. Brown of the arrangement and application of electricity to the brake and lighting of Locomotives and ordinary Rail Road cars. The diagrams, to be current attached to make a light, of Locomotive are the cow-catcher, and Locomotive undergear to be bell-cord. Managed by the Engineer from the engine cab. The current to Also

Electrifying Horse & other tools } were sketched by him of which one given to Mr. Note from which to make Patent Office drawings.

Electric Lamp Dissolves } And I find in Mr. Francis's office sketches of two systems of operating lamps by Electricity. One consists of carrying the current along the canal by

insulated conductors from which the current is carried to motor, on board of boat which drives a screw propeller. The other is to lay lain along the towpath one wire, a motor with hand-over hand clutch gear travels and by line or otherwise towes the boat or barge.

Applications to be made } I find in Mr. Edison's Boots 108 page 3 &c. a list of applications to be made of the system to brown lighting &c. Note for lamp and enthusiasm purposes when light or brown or both may be used. and

Lights Taken on Monday Crosby and Lawson left for the week.

Romantum. Two were slightly damaged yesterday by a cover. and that

Foundation Men had commenced digging for the foundation for the Porter Engine. (August 4th 1880)

Wednesday July 7-80

Sister Platts & Mr Ott made a couple large glass plates to hold his red fire and explosive carbonized lines of that length, in the glass plates and then long straight wires, that have been burned. The carbons came out very brilliant.

Fire bricks are being drawn for Agnes for the arrangement for burning coal dust under the boiler.

Flora. A collection of Bamboo Reed and choice Bark have been obtained and some corks are not but more yet put in the lamps to test.

Vacuum test. In furtherance of trial of vacuum mentioned under July 3. A lamp was placed direct to the pump and after good vacuum the pump was taken apart at tube connecting the drop with gauge tube, and lamp allowed to remain burning for a long time. No fall could be shown for some time, but finally a small bubble of air was let in heard in and vacuum dropped accordingly. but immediately began to inbrow again, without working the pump, showing that the air was either absorbed or used up in the oxidizing the carbon. Part of the above added to note of July 3

Working drawings. Mr Edison had Henry or at least urged him to make working drawings of the applications of the current for light and power as per list in, page 3 of Book 108 Business memo. Notes of work during my absence (see diary)

Magnetic Brake. The box or Pullman car was painted, raised up on blocking, apparatus to pouring on the magnet for brake, which Smith is preparing, and has nearly ready for other cars

Twilight. Oct. One of the accumulators is found quite dry, was

[illegible]

Thursday July 8.

Sparker & Lamp. Mr. Edison attached on page 145 Book 68 a lamp with spark tube attached for the purpose of further observations on the loss of vacuum. One sealed off the pump last night and was tested to day. The sparker was connected with the condenser and two batteries. and the lamp on the Dynamo current. According to the color in the sparker, the vacuum lost some. Book No. 104 page 106 &c.

Mr. Sharp and Mr. Barnes is now the Machine made of the Fish plates. Mark Free where was the track of Tramway to day and replaced up all the fish plates. and down at the top of the hill removed one from each rail. to test the connection and saw the loss occasioned by fresh dirt &c. being thrown on the rail below when the wire are at work on the extension.

Long Rest. Two Lamps of six inch Rest Film were made to day and tested. The first tested 200 ohms resistance. 8 per horse power at 16 candles. set at 44 candles showed as the and lasted twenty minutes. Second one 147 ohms resistance lice common and blew at 44 candles burned forty minutes when engine stopped. Book 104 page 18 &c.

Poles. Two very long poles were delivered on the ground and one of them raised at the lamp factory for the experiment for power and telephone.

Brake Magnets. The magnets for the magnetic Brake were wound with six layers of 0.032 wire and the power run till twelve o'clock to finish them up for ready for putting on in the morning.

Visitors. Mc Mahon, and Mc Langhlin with three California friends, also Dr. visited a short time.

Friday July 9.

Papers. Scientific American date July 17 contains a cut and description of Edison's Magnetic Slot separator. Also cost of maintaining horse power per hour from experiments and observations made by Bissinger. Steam engine 100 horse power 7.6 per horse power per hour. Same 2 h.p. 44.5 do. Lehmann's caloric eng. 2 h.p. 26.5 do and Otto Gas Eng. 2 h.p. 26.4 per horse power per hour.

Screw Gear was set running in the lathe to scover the cog bearings.

6th Carbons. The lamp which remained burning when the engine stopped at twelve o'clock last night was broken this morning by having the electro-motive force run up, in attempting to set it again at 44 candles.

A second lamp was mounted on the pump and tested. 275 ohms cold. 174 ohms hot at 16 candles and gave 6.9 per horse power. Set at 44 candles it lasted about one hour.

Wood Miller. Dean is running the face cutting tools of his wood Loop miller from one counter shaft which being hinged having the bearings linear and being weighted acts also as a tightener and allows of the carriage in which the cutters are secured, being moved backwards and forwards without any strain on the belts. He did not stop it practically to day but merely run for awhile to wear and polish the bearings.

Captive Balloon. Mr. Batchelor made an apparatus to experiment on an electric Captive Balloon. An upright pair of

Magnets are used and the mode
armature made to revolve betw
